

European Enhanced Vehicle-safety Committee

Overview of the current research of EEVC WG13 – Side Impact

Adrian Roberts (TRL, UK)
 Chairman EEVC WG13
 Secretary of the EEVC Steering Committee
 EEVC member IHRA SIWG

35th meeting GRSP

5/5/04 EEVC WG13 Slide 1

European Enhanced Vehicle-safety Committee

Background to EEVC work in side impact

- Initial research to an MDB test procedure was led by WG 9
- Regulation 95 became Europe's first full-scale side impact test procedure
 - Foundations started to take shape in the mid 1980's
 - Key elements -
 - EuroSID-1 (finalised 1989)
 - MDB face and test procedure
- A simple highly repeatable perpendicular test
- Protection for front seat occupant (Front & rear recommended by EEVC)
- MDB based on vehicle characteristics of the 1970's – French LCW

5/5/04 EEVC WG13 Slide 2

European Enhanced Vehicle-safety Committee

Regulation 95

- Regulation 95 recently updated
 - EuroSID-1 ➔ ES-2 (WG12)
 - Revised MDB specification (WG13)
General shape and performance now supplemented by design and build requirements
- Recognition that further procedures are necessary to assess all appropriate areas for increased head protection
- EEVC WG13 tasked by the EEVC Steering Committee with the development of an appropriate 'Interior Surface Test Procedure'

5/5/04 EEVC WG13 Slide 3

European Enhanced Vehicle-safety Committee

IHRA

International Harmonised Research Activities

- IHRA was created 1996 to co-ordinate research that could lead to harmonised (worldwide) test procedures
- Two members of WG13 lead the EEVC contributions within the IHRA Side Impact Working Group

5/5/04 EEVC WG13 Slide 4

European Enhanced Vehicle-safety Committee

IHRA SIWG current status

IHRA Side Impact Working Group (SIWG) is developing a suite of four advanced test procedures

- Barrier based
 - Two versions, since global markets are different
 - North American – reflecting large SUV & Trucks
 - European (Japan) – reflecting European cars & the small SUV
- Interior Surface
- Pole test
- Out of Position, airbag

Europe – EEVC WG13

5/5/04 EEVC WG13 Slide 5

European Enhanced Vehicle-safety Committee

European MDB - AE-MDB

- First stage research - Investigation into what is appropriate for the European accident situation and current vehicle fleet
- Base line tests performed - moving car to moving car impacts
- Protection of both front and rear seat occupants (IHRA target)
 - Bullet vehicles – Typical European Cars and European SUV
 - Assessment of impact severity based on vehicle damage and dummy measurements - Initially using EuroSID-1 but now using ES-2. *In the future WorldSID (5th IIR)?*
- Barrier stiffness - derived through load cell wall and geometrical studies

5/5/04 EEVC WG13 Slide 6

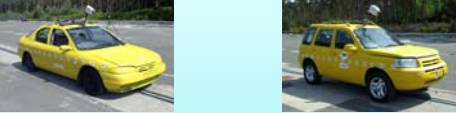

European Enhanced Vehicle-safety Committee

Initial baseline tests – further vehicles now added

Target vehicles - Renault Megane - Toyota Camry

Bullet vehicles - Ford Mondeo - Freelander

European Enhanced Vehicle-safety Committee

Current AE-MDB research

- Refining the AE-MDB design & build specification
- Performing broader range of vehicle tests.
- WG13 hopes to complete current study by August
- European validation EC 6th Framework APROSYS
- Interaction with WorldSID
- Interaction with the other IHRA SIWG test procedures.

5/5/04 EEVC WG13 Slide 16

Head impact assessment

5/5/04 EEVC WG13 Slide 17

European Enhanced Vehicle-safety Committee

Free Motion Headform

- Initial EEVC studies directed towards European application
- WG13 studied European injury situation – contact zones
- Selection of an appropriate headform impactor
- Choice of headform guidance/launch methods
- Development of a test procedure
- WG13 aware of FMVSS 201 but was directed by the EEVC SC to consider 'What would be appropriate for Europe'.
- Focussed on front seat occupant protection
- IHRA extension – now incorporates rear seat positions

5/5/04 EEVC WG13 Slide 18

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

1. Impactor selection
 - Evaluated early EEVC Pedestrian (WG17), FMH (201) & AAAM headform impactors
 - A range of tests performed into various structures and paddings
 - No clear winner from this comparison
 - FMH selected based on harmonisation considerations

Results published ESV paper 1996

5/5/04 EEVC WG13 Slide 19

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

2. Guidance methods
 - Linear vs. free flight – Are both acceptable?
 - Testing strongly suggested that linear guidance raised a number of complex issues
 - WG13 decided that launch and guidance should be restricted to 'free flight'

5/5/04 EEVC WG13 Slide 20

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

3. Injury criteria *(equivalence to the EuroSID as used in Regulation 95)*
 - A programme of sled tests were performed into a range of structures using the EuroSID generating 'injurious' head impacts
 - Equivalent severity tests with the FMH undertaken
 - Correlation found to be very similar to the FMVSS 201 regression
 - Considering harmonisation WG13 chose to adopt the FMVSS 210 HIC_{dummy} equivalence function

5/5/04 EEVC WG13 Slide 21

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

4. Desire to encourage 'overall protection' and 'worse case' evaluation
5. Worst case impacts thought to be perpendicular to the surface

Status paper - ESV 2003

5/5/04 EEVC WG13 Slide 22

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

5/5/04 EEVC WG13 Slide 23

EEVC European Enhanced Vehicle-safety Committee

Free Motion Headform

- A range of issues have and are still being investigated by WG13
- Active Head Protection Systems (HPS) are being evaluated using a perpendicular pole test, using ES-2 – based on EuroNCAP procedure.
- Studies continue within EEVC WG13:
 - Examining the practicality of the procedure
 - Reducing interpretation problems and possible ambiguity
 - A broader based evaluation of active systems
 - Give benefit if active systems are fitted and work

5/5/04 EEVC WG13 Slide 24

Free Motion Headform

- The European version of the procedure only covers front seat occupant protection
- The IHRA version covers both front and rear occupants
 - Rear seat impact zone definition under investigation
- Both versions include the assessment of active systems through a pole test.
 - Current WG13 procedure is based on a perpendicular pole test
 - The IHRA pole test is likely to be an oblique pole
 - Information on the equivalence between configurations is needed*
- It is hoped that the procedure(s) will be sufficiently robust for broader based evaluation from August, after next WG13 meeting

Thank you for your attention

Countries represented in WG13

France, Germany, Netherlands, Italy, Spain, Sweden, UK
