Report on Flex-G Car Test Results

Purpose of the Test

- (1) To determine change in measurement results following the change in impactor specifications.
- (2) To conduct a feasibility study on the new impactor Flex-G.

Summary of Test Results

Max. values for leg bending moment; MCL values for knee ligament

	F l ex- 04		F l ex- G		TRL		
	MCL	Leg	MCL	Leg	Bending	Shearing	G
	(mm)	(Nm)	(mm)	(Nm)	(°)	(mm)	(G)
Production model	19.11	257.41	* 30.57	(190.98)	8.9	2.83	113.3
Measure-1	11.90	187.46	* 23.40	(251.23)			
Measure-2			* 23.67	(372.72)	4.8	ND	115.0

Exceed proposed protection criteria (Leg>350Nm, MCL>20mm)

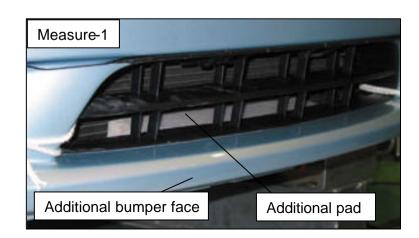

Figures in () indicate the maximum values before MCL exceed 200 mm.

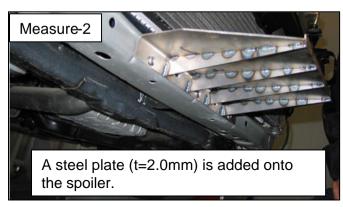

* Measurement was not possible due to overshooting.

Vehicle Specifications ____

Measure-1: Additional bumper face + Forward placement

Measure-2: Additional plate below bumper

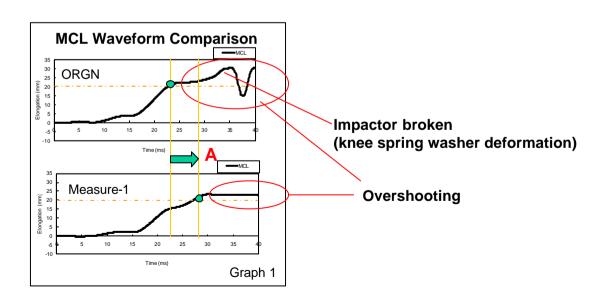

Test Results and Proposal

Test Results:

- (1) Flex-G recorded an excess elongation of knee ligament (overshooting) with the production-model, measure-1 and measure-2 vehicles.
- (2) Although the forward placement and reinforcement of a lower bumper structure appeared effective (see A), the quantitative prediction of effectiveness was difficult.

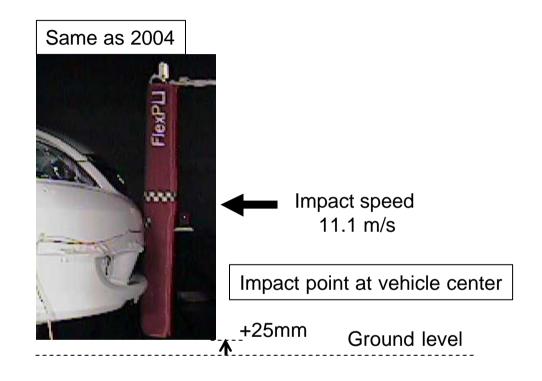

Proposal:

JAMA proposes that Flex-G's measurement upper limit for knee ligament elongation be raised in order to widen the measurable ligament elongation range.
