

## Summary of Existing Crash Test and Simulation Data

This table is intended to collect information to summarise the existing pole impact test and simulation data available to the Informal Group (current regulatory or NCAP tests need not be included). This will give the group a general idea of available information, and any gaps that may require further research. The list may also form the basis for initial discussion on possible test methods, but is not intended to presuppose the direction of the possible standard. Please only include details of studies that you are able / prepared to share within the group.

This may include results for verbal discussion only.

Australia will collate the responses into a summary for discussion at the meeting.

Please include previously published work if you believe that it is relevant to the GTR proposal.

Any additional information about test variables may be included in the comments section.

The table is populated with Australian tests to serve as examples.
