Inland Transport Committee

World Forum for Harmonization of Vehicle Regulations

Working Party on Brakes and Running Gear

Seventy-sixth session

Geneva, 17–21 February 2014 Item 5(b) of the provisional agenda Motorcycle braking – Global Technical Regulation No. 3

Proposal for amendments to Global Technical Regulation No. 3 (Motorcycle brake systems)

Submitted by the representative from Italy*

The text reproduced below was prepared by the expert from Italy to introduce amendments clarifying the current text for the use of Combined Braking Systems (CBS). The modifications to the current text of the Regulation are marked in bold for new or strikethrough for deleted characters.

In accordance with the programme of work of the Inland Transport Committee for 2012–2016 (ECE/TRANS/224, para. 94 and ECE/TRANS/2012/12, programme activity 02.4), the World Forum will develop, harmonize and update Regulations in order to enhance the performance of vehicles. The present document is submitted in conformity with that mandate.

Statement of technical rationale and justification

I. Objective

The objective of this proposal is to recommend the adoption of an amendment to the current Global Technical Regulation (GTR) on motorcycle brake systems. At the June 2013 session of the Executive Committee (AC.3), Contracting Parties to the 1998 Global Agreement, under the World Forum for Harmonization of Vehicle Regulations (WP.29), gave their consent to amend UN GTR on Motorcycle Brake Systems (UN GTR No. 3).

II. Introduction

- 1. One of the main purposes of UN GTR No. 3 is to reduce the injuries and fatalities associated with motorcycle accidents by addressing the braking performance of motorcycles as a means of improving road safety.
- 2. UN GTR No. 3 provides clear and objective test procedures and requirements that can be easily followed and also addresses the development in current Combined Brake Systems (CBS) and Anti-lock Braking System (ABS) technologies.
- 3. The current provision in UN GTR No. 3 (paragraph 3.1.9), requiring that "two separate brake systems may only share a common brake if a failure in one system does not affect the performance of the other", limits the application of CBS.
- 4. Not all CBS architectures can meet this requirement although they will outperform conventional brake systems.
- 5. Not all CBS architectures were, however, considered at the time the original CBS requirements were drafted in the 1980s and it is, therefore, understood that GRRF did not intentionally exclude such systems by introducing this requirement.
- 6. In order to ensure that, in case of a failure in one system, the performance of the other system still equals that of a conventional system, it is proposed to allow that two separate brake systems share a brake and/or a transmission, provided that the other system meets the single brake system performance requirements in case of a failure of such shared components(s). To that end, a failure test is proposed for CBS brake systems of Architecture B. Italy is of the opinion that such a failure test requirement should ensure the acceptance of such a CBS in terms of demonstrated robustness and guaranteed minimum braking performance.

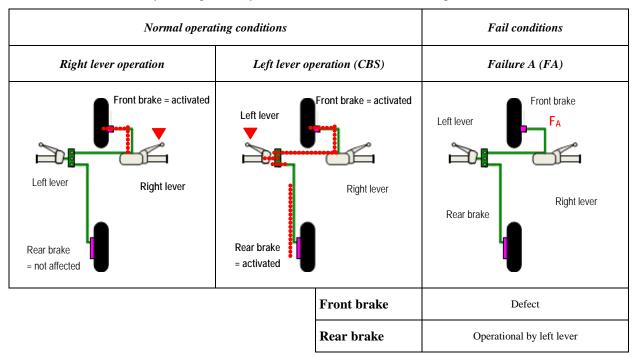

III. Justification of changes

- 7. The current provision in UN GTR No. 3 (para. 3.1.9), requiring that "two separate brake systems may only share a common brake if a failure in one system does not affect the performance of the other", limits the application of Combined Brake Systems (CBS).
- 8. Not all CBS architectures can meet this requirement although they will outperform conventional brake systems.
- 9. Not all CBS architectures were however considered at the time the original CBS requirements were drafted (in the 1980s) and it is therefore understood that GRRF did not intentionally exclude such systems by introducing this requirement.
- 10. Architecture B is an example of a CBS that shares a transmission (T_s) and a brake (B_s) .

Conventional Brake System	Combined Brake System (CBS)		
Architecture A	Architecture B	Architecture C	
Front brake Right lever Left lever Pedal Rear brake	Left lever Front brake (B _s) Right lever Rear brake Equalizer	Left lever Front brake Right lever Rear brake Pedal	
 Left lever (pedal) operates rear brake only Right lever operates front brake only 	 Left lever operates CBS Right lever operates front brake only 	 Left lever (pedal) operates CBS Right lever operates front brake only 	

CBS Architecture B

11. While a failure in e.g. the "front system" (F_A) may affect the performance of the CBS, the rear system (operated by the left lever) will continue to be operational.

12. In order to ensure that, in case of a failure in one system, the performance of the other system still equals that of a conventional system, it is proposed to allow that two separate brake systems share a brake and/or a transmission, provided that the other system meets the single brake system performance requirements in case of a failure of such shared components(s). To that end, a failure test is proposed for CBS brake systems of

Architecture B. Italy is of the opinion that such a failure test requirement should ensure the acceptance of such a CBS in terms of demonstrated robustness and guaranteed minimum braking performance.

Other CBS architectures such as Architecture C

13. A failure test is not necessary for this type of CBS architecture because there are no shared components with the exception of a brake cylinder which is one of the components that are regarded to not be liable to breakage as described in 4.12.1. (b).

IV. Proposal

Paragraph 3.1.9, amend to read:

"3.1.9 In cases where two separate service brake systems are installed, the systems may share a common brake, if a failure in one system does not affect the performance of the other a common transmission, or both if the requirements of paragraph 4.12 are met."

Insert new paragraph 4.12, to read:

"4.12. CBS failure test

4.12.1. General information:

- (a) This test will only apply to vehicles fitted with CBS of which the separate service brake systems share a common brake, common transmission or both:
- (b) The test is to confirm the performance of the service brake systems in the event of a common hydraulic hose or mechanical cable failure.

4.12.2. Test conditions and procedure:

- (a) Alter the brake system to produce a hydraulic hose or mechanical cable type failure causing a complete loss of braking in the portion of the system which is shared.
- (b) Perform the dry stop test specified in section 4.3. in laden condition. Other conditions to be observed are in paragraphs 4.3.1. (c) and 4.3.2. (a), (b), (d), (e) and (f). Instead of the provisions in section 4.3.2. (c), only apply the control for the service brake system not affected by the simulated failure.

4.12.3. Performance requirements

When the brakes are tested in accordance with the test procedure set out in paragraph 4.12.2., the stopping distance shall be as specified in column 2 or the MFDD shall be as specified in column 3 of the following table:

Column 1	Column 2	Column 3	
	STOPPING DISTANCE (S)		
Vehicle	(Where V is the specified test speed in km/h and	MEDD	
Category	S is the required stopping distance in metres)	MFDD	
Front wheel(s) braking only			
3-1	$S \le 0.1 \text{ V} + 0.0111 \text{ V}^2$	\geq 3.4 m/s ²	
3-2	$S \le 0.1 \text{ V} + 0.0143 \text{ V}^2$	\geq 2.7 m/s ²	
3-3	$S \le 0.1 \text{ V} + 0.0087 \text{ V}^2$	\geq 4.4 m/s ²	
3-4	$S \le 0.1 \text{ V} + 0.0105 \text{ V}^2$	\geq 3.6 m/s ²	
3-5	$S \le 0.1 \text{ V} + 0.0117 \text{ V}^2$	\geq 3.3 m/s ²	
Rear wheel(s) braking only			
3-1	$S \le 0.1 \text{ V} + 0.0143 \text{ V}^2$	\geq 2.7 m/s ²	
3-2	$S \le 0.1 \text{ V} + 0.0143 \text{ V}^2$	\geq 2.7 m/s ²	
3-3	$S \le 0.1 \text{ V} + 0.0133 \text{ V}^2$	\geq 2.9 m/s ²	
3-4	$S \le 0.1 \text{ V} + 0.0105 \text{ V}^2$	\geq 3.6 m/s ²	
3-5	$S \le 0.1 \text{ V} + 0.0117 \text{ V}^2$	\geq 3.3 m/s ²	

"
