Tottenham Court Road Underground station is being completely redeveloped as part of TfL's programme to transform the Tube. The £1bn transformation of Tottenham Court Road will be the biggest transport investment in the West End for decades, providing congestion relief, delivering a bigger ticket hall, additional escalators, step-free access, and interchange with Crossrail services.

Built over a century ago as two separate Tube stations, Tottenham Court Road was not designed to cope with the almost 150,000 passenger journeys that are now made through the station every day. With the expected rise in passenger numbers interchanging between London Underground services and Crossrail in 2018, the existing station is being upgraded to meet the expected rise in demand for this key central London station for years to come.
