(sent 04. July 2012)

From: The Residents of the Bakalarzewo municipality

As the residents of Bakalarzewo municipality we would like to inform that we strongly disagree to build the electrical power lines with a voltage of 2x400kV in Bakalarzewo municipality area.

The investment that will be according to the current plan endangered our life and health.

In our opinion the investment is too close to our houses. Furthermore, the investment projects a lot of creases, which will cause the extending of electromagnetic field impact (EMF).

Additionally, the construction of the electrical power lines with a voltage of 2x400kV is being situated parallel to the already existing power line 110kV. We would like to emphasize that the area exactly below the power line is the place of our work and living. Being the farmers we are already exposed to the electromagnetic field for 24 hours a day and building the electrical power lines with a voltage of 2x400kV will extend the threat. We live, bringing up our children at the Bakalarzewo municipality area. We also produce food here.

Therefore we would like to get to know the opinion of District Sanitary-Epidemiological Station in Suwalki concerning farmers' work and living conditions near the electrical power lines with a voltage of 2x400kV. We should also take into consideration the fact that the exposure of electromagnetic field impact for the working farmers ought to be less than for workers of the energy production.
