## Results of the Taber Round Robin test performed within the IGPG

2011-05-27

Polycarbonates

# Information

---

At the 1<sup>st</sup> meeting of the informal group on plastic glazing (IGPG) on 18.-19.01.2011 in Paris it was decided to establish a task force for conducting a Taber Round Robin test.

The objective of this Round Robin test is to answer the following question as basis for upcoming decisions: “Do the test laboratories all get the same results, when performing the Taber abrasion test?”

Four members of the task force promised to deliver test samples for this Round Robin test. Different types of samples from three members were delivered to the test laboratories, while one sample producer was not able to deliver samples in time for testing and result presentation at the 2<sup>nd</sup> IGPG meeting.

Available types of samples for the Round Robin test:

- monolithic float glass
- hard coated polymethylmethacrylate (PMMA)
- hard coated polycarbonate (PC)

## Polycarbonates

# Information

---

Twelve test laboratories indicated their interest in participating and received samples (3 different types of samples (3 identical samples each type)). One test laboratory received two sets of samples since they wanted to check the influence of two different test procedures.

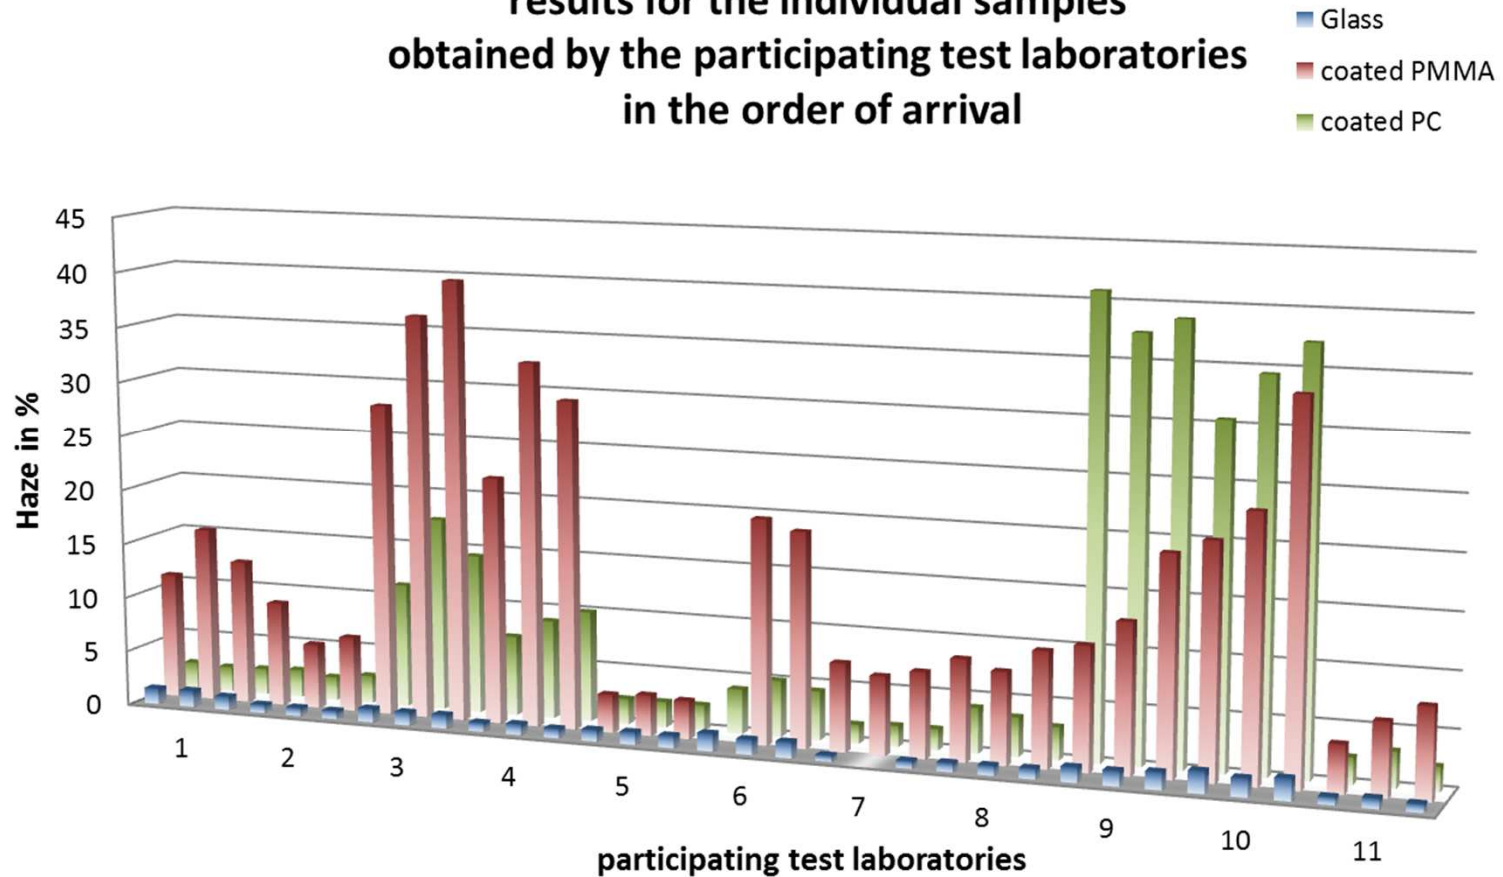

Eleven test laboratories performed the test and transmitted their results, one test laboratory decided however after receiving samples not to participate. One test laboratory which performed the test has already internally decided not to use the test anymore. Since they have used already expired wheels (instead of investing into new ones) their results are not included here.

Therefore on the next pages the results of nine test laboratories for three different types of samples (three samples each type), and of one test laboratory for two sets of samples using two different test procedures are presented (treated on the following pages as two test laboratories).

Test procedure details for these eleven data sets (one set includes three different types of samples with 3 identical samples for each type) can be found in the backup.

# Test results

results for the individual samples  
obtained by the participating test laboratories  
in the order of arrival

Polycarbonates

# Summary of test results

	<b>Glass</b>	<b>coated PMMA</b>	<b>coated PC</b>
	$\Delta$ haze [%]		
Lowest measured value	0,58	3,46	1,70
Highest measured value	2,00	39,94	40,90
Arithmetic mean of all values	<b>1,18</b>	<b>15,44</b>	<b>10,52</b>
Standard deviation	<b>0,37</b>	<b>10,59</b>	<b>13,11</b>

# Detailed test results

Glass arithmetic mean with standard deviation for each test laboratory in the order of increasing values

Polycarbonates

# Detailed test results

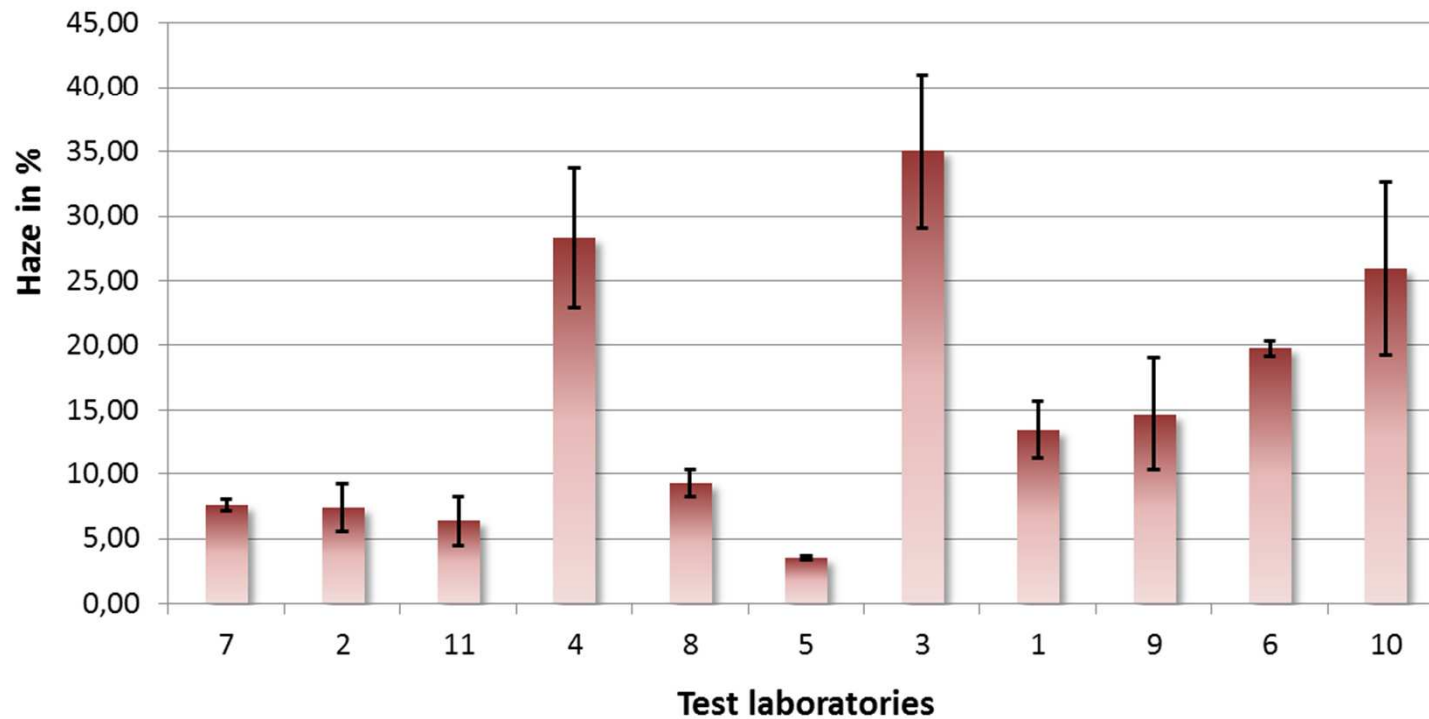

coated PMMA arithmetic mean with standard deviation  
for each test laboratory in the order of increasing  
values

Polycarbonates

# Detailed test results

coated PMMA arithmetic mean with standard deviation  
for each test laboratory (in the order of increasing  
values for glass)

Polycarbonates

# Detailed test results

coated PC arithmetic mean with standard deviation for each test laboratory in the order of increasing values

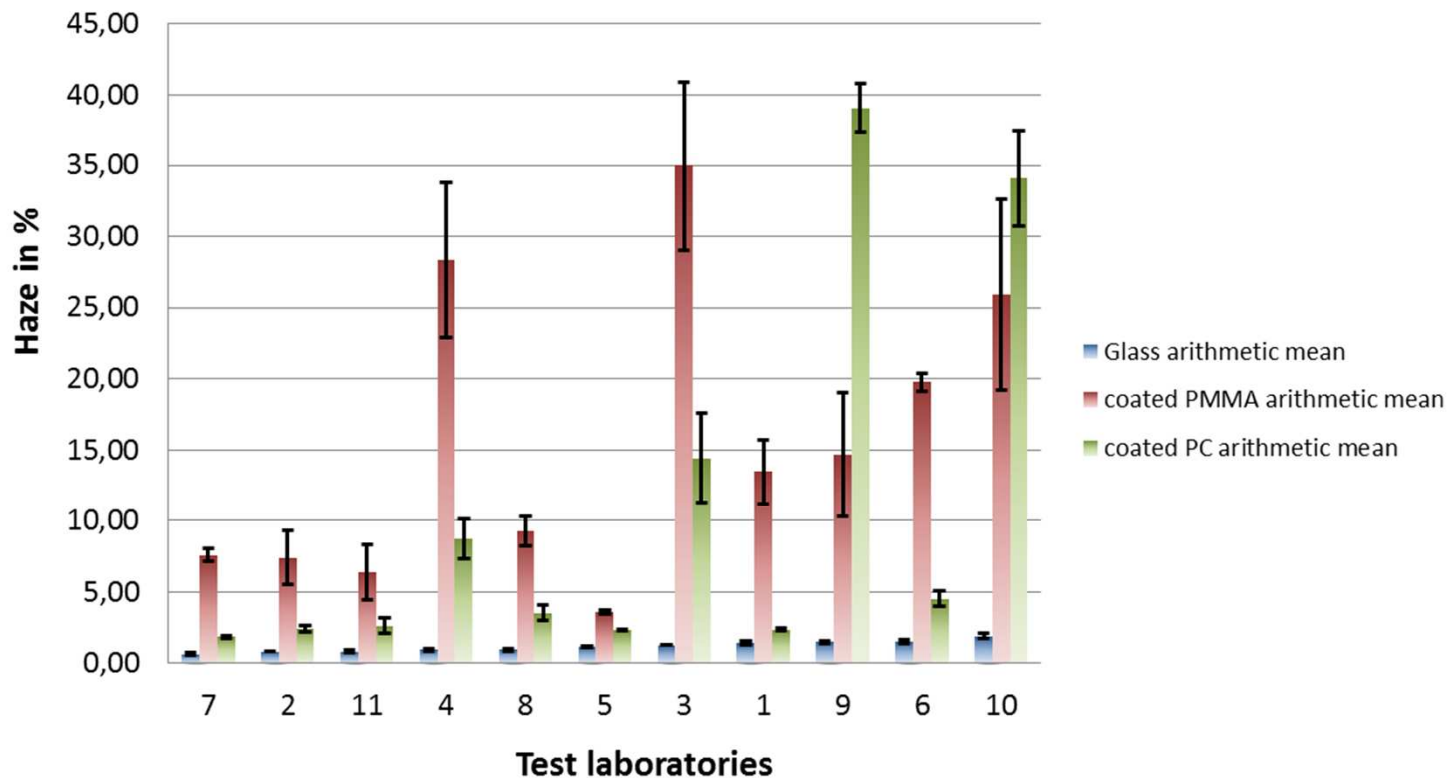

# Detailed test results

coated PC arithmetic mean with standard deviation for each test laboratory (in the order of increasing values for glass)

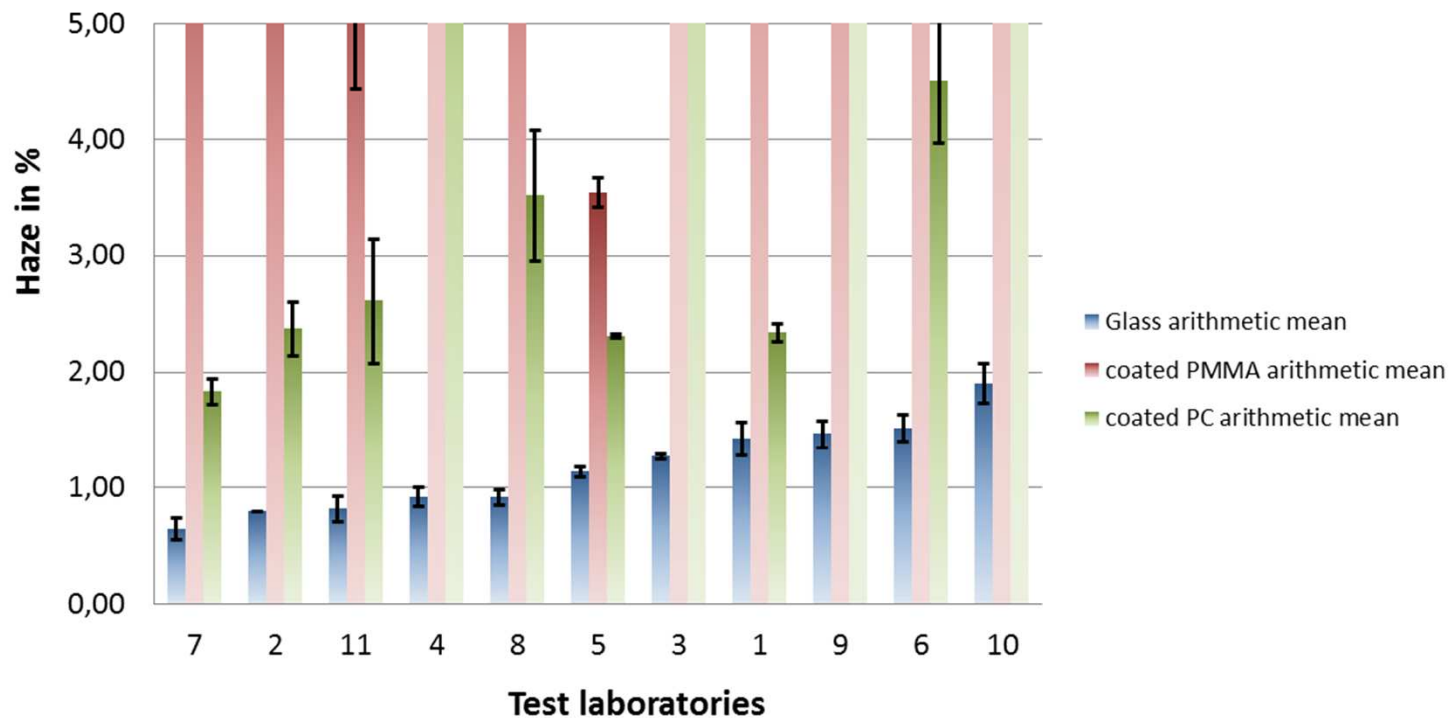

# Summary of detailed test results

arithmetic means with standard deviation for each test laboratory (in the order of increasing values for glass)

# Summary of detailed test results

arithmetic means below 5% with standard deviation for each test laboratory (in the order of increasing values for glass)

# Backup

test laboratory	1			
tested according to test details	ASTMD1044-8			
wheel type and lot number	Type: CS-10F; Lot Number: DW23D2 (expire SEP 2012); Load: 500g per wheel			
refacing medium	Refacing Medium: ST-11 Refacing Stone (25 cycles prior to test, lightly brush wheels after refacing)			
vacuum nozzle orifice size	Vacuum Nozzle Orifice: 11mm Vacuum Nozzle Gap: nozzle positioned 1/32" above specimen			
serial number of instrument and date of last calibration	Model Number: Taber Rotary Platform Abraser Model 5150; Serial Number: 968627; Calibration Date: April 14, 2011			
other information	Conditioning Temp: 68°F; Conditioning RH (%): 49%; Conditioning Time: >40h; HazeMeter: Byk-Gardner Haze-Gard Plus with Taber Holder; Initial Haze Measurement > Using soft bristle, anti-static brush lightly brush off any debris > Wipe specimen surface with lint free cloth; Final Haze Measurement > Using soft bristle, anti-static brush lightly brush off any debris > Using Isopropyl alcohol soaked lint free cloth, gently wipe & clean both sides
