# Proposal for amendments to Documents 

ECE-TRANS-WP29-GRPE-2012-07
and
ECE-TRANS-WP29-GRPE-2012-06

The text reproduced below was prepared by the Chair of the informal group on Gaseous Fuelled Vehicles (GFV) to correct a measurement error contained in docs. ECE-TRANS-WP29-GRPE-2012-06 (R83) and ECE-TRANS-WP29-GRPE-2012-07 (R.115) when weighing method and G25 reference fuel are used. The modifications to the original English text are marked in bold for new or strikethrough for deleted characters.

## I. Proposal

Annex 6A of doc. ECE-TRANS-WP29-GRPE-2012-07 Paragraph 2., amend to read:
2. Calculation of the LPG energy ratio

The fuel consumption value shall be calculated from the emissions of hydrocarbons, carbon monoxide, and carbon dioxide determined from the measurement results assuming that only LPG is burned during the test.

The LPG ratio of the energy consumed in the cycle is then determined as follows:
$\mathrm{G}_{\mathrm{LPG}}=\mathrm{M}_{\mathrm{LPG}} * 100 \underline{00} /(\mathrm{FCmean} *$ dist $* \mathrm{~d}) * 100 \%$
Where:
$\mathrm{G}_{\mathrm{LPG}}$ : the LPG energy ratio (\%);
$\mathrm{M}_{\mathrm{LPG}}$ : the LPG mass consumed during the cycle (kg);
$\mathrm{FC}_{\text {mean }}$ : the mean fuel consumption $\underline{(\mathbf{l} / \mathbf{1 0 0} \mathbf{k m})}$ calculated in accordance with paragraph
6.1.2.4.3.2.;
dist: distance travelled during the cycle ( km );
d : density $\mathrm{d}=0.538 \mathrm{~kg} /$ liter."

Annex 6B of doc. ECE-TRANS-WP29-GRPE-2012-07 Paragraph 2., amend to read:

## 2. Calculation of the CNG energy ratio

The fuel consumption value shall be calculated from the emissions of hydrocarbons, carbon monoxide, and carbon dioxide determined from the measurement results assuming that only CNG is burned during the test.
The CNG ratio of the energy consumed in the cycle is then determined as follows:
$\mathrm{G}_{\mathrm{CNG}}=\mathrm{M}_{\mathrm{CNG}} \underline{* \mathbf{c f} * 100 \underline{00} /\left(\mathrm{FC}_{\text {mean }} * \text { dist } * \mathrm{~d}\right) * 100 \%}$
Where:
$\mathrm{G}_{\mathrm{CNG}}$ : the CNG energy ratio (\%);
$\mathrm{M}_{\mathrm{CNG}}$ : the CNG mass consumed during the cycle (kg);
$\mathrm{FC}_{\text {mean }}$ : the mean fuel consumption ${\left.\underline{\left(\mathbf{m}^{3}\right.} \mathbf{} / \mathbf{1 0 0} \mathbf{k m}\right) \text { calculated in accordance with paragraph }}$ 6.2.2.4.3.2.;
dist: distance travelled during the cycle ( km );
d : density $\mathrm{d}=0.654 \mathrm{~kg} / \mathrm{m}^{3}$
cf: correction factor, assuming the following values:
cf $=1 \quad$ in case of $\mathbf{G}_{20}$ reference fuel
cf $=\mathbf{0 . 7 8} \quad$ in case of $\mathbf{G}_{25}$ reference fuel

Annex 12 Appendix 1 of doc. ECE-TRANS-WP29-GRPE-2012-06 Paragraph 2., amend to read:

## 2. Calculation of the LPG energy ratio

The fuel consumption value shall be calculated from the emissions of hydrocarbons, carbon monoxide, and carbon dioxide determined from the measurement results assuming that only LPG is burned during the test.
The LPG ratio of the energy consumed in the cycle is then determined as follows:
$\mathbf{G}_{\mathrm{LPG}}=\mathrm{M}_{\mathrm{LPG}} * 100 \underline{00} /\left(\mathrm{FC}_{\text {norm }} *\right.$ dist $\left.* \mathrm{~d}\right)$
Where:
$\mathrm{G}_{\mathrm{LPG}}$ : the LPG energy ratio (\%);
$\mathrm{M}_{\mathrm{LPG}}$ : the LPG mass consumed during the cycle (kg);
$\mathrm{FC}_{\text {norm }}$ : the fuel consumption ( $\mathbf{l} / \mathbf{1 0 0} \mathbf{k m}$ ) calculated in accordance with Paragraph 1.4.3., letter (b), of Annex 6 to Regulation No. 101. If applicable, the correction factor $\mathrm{c} f$ in the equation used to determine $\mathbf{F C}_{\text {norm_s }}$ shall be calculated using the $\mathrm{H} / \mathrm{C}$ ratio of the gaseous fuel;
dist: distance travelled during the cycle (km);
d: density $\mathrm{d}=0.538 \mathrm{~kg} /$ liter."

Annex 12 Appendix 2 of doc. ECE-TRANS-WP29-GRPE-2012-06 Paragraph 2., amend to read:

## 2. Calculation of the CNG energy ratio

The fuel consumption value shall be calculated from the emissions of hydrocarbons, carbon monoxide, and carbon dioxide determined from the measurement results assuming that only CNG is burned during the test.
The CNG ratio of the energy consumed in the cycle is then determined as follows:
$\mathrm{G}_{\mathrm{CNG}}=\mathrm{M}_{\mathrm{CNG}} * \underline{* \mathbf{c f} * 10000} /\left(\mathrm{FC}_{\text {norm }} *\right.$ dist $\left.* \mathrm{~d}\right)$
Where:
$\mathrm{G}_{\mathrm{CNG}}$ : the CNG energy ratio (\%);
$\mathrm{M}_{\mathrm{CNG}}$ : the CNG mass consumed during the cycle (kg);
$\mathrm{FC}_{\text {norm }}$ : the fuel consumption ( $\mathbf{m}^{\mathbf{3} / \mathbf{1 0 0} \mathbf{k m})}$ calculated in accordance with Paragraph 1.4.3., letter (c), of Annex 6 to Regulation No. 101;
dist: distance travelled during the cycle (km);
d : density $\mathrm{d}=0.654 \mathrm{~kg} / \mathrm{m}^{3}$
cf: correction factor, assuming the following values:
cf $=1 \quad$ in case of $\mathbf{G}_{20}$ reference fuel
$\mathbf{c f}=\mathbf{0 . 7 8} \quad$ in case of $\mathbf{G}_{25}$ reference fuel

## II. Justification

Documents ECE-TRANS-WP29-GRPE-2012-07 (referring to R115) and ECE-TRANS-WP29-GRPE-2012-06 (referring to R83) introduce the calculation of NG/biomethane energy ratio during a type I cycle by weighing the NG/biomethane mass consumed. The formulas introduced respectively in Annex 6 (ECE-TRANS-WP29-GRPE-2012-07) and Annex 12 Appendix 2 (ECE-TRANS-WP29-GRPE-2012-06) are affected by an error when $G_{25}$ reference fuel is used. The error is due to the presence of inert gas $\left(N_{2}\right)$ in the $G_{25}$ reference fuel, varying from 12 to $16 \%$ in molar fraction units.
This proposal describes a modification to previous formulas in order to take into account the presence of inert gas and providing the correct energy ratio. When $G_{25}$ reference fuel is used, its composition is known and the mass of inert gas in it can be calculated.
$R 83$ fixes the allowed ranges for both $\mathrm{CH}_{4}$ molar fraction and $N_{2}$ molar fraction in $G_{25}$ reference fuel. If we assume $x_{C H 4}$ the molar fraction of $\mathrm{CH}_{4}$ and $x_{N 2}$ the molar fraction of $\mathrm{N}_{2}$, we have:
$\begin{array}{ll}x_{\text {CH4 }}=n_{\text {CH4 }} / n_{\text {TOT }} & \left(\text { for } G_{25}: 0.84 \leq x_{\text {CH4 }} \leq 0.88\right) \\ x_{N 2}=n_{N 2} / n_{\text {TOT }} & \left.\text { (for } G_{25}: 0.12 \leq x_{N 2} \leq 0.16\right)\end{array}$
where:
$n_{\text {CH4 }}$ is the number of moles of $\mathrm{CH}_{4}$
$n_{N 2}$ is the number of moles of $\mathrm{N}_{2}$
$n_{\text {TOT }}$ is the total number of moles
Since the mass of $\mathrm{CH}_{4}$ and $\mathrm{N}_{2}$ expressed in grams can be calculated as follows:
$m_{\text {CH4 }}=n_{\text {CH4 }} * P M_{\text {CH4 }}$
$m_{N 2}=n_{N 2} * P M_{N 2}$
where:
PM CH4 is the molar mass of $\mathrm{CH}_{4}=16.042 \mathrm{~g} / \mathrm{mol}$
$P M_{N 2}$ is the molar mass of $N_{2}=28.02 \mathrm{~g} / \mathrm{mol}$
Combining previous equations:
$m_{\text {CH4 }}=x_{\text {CH4 }} * n_{\text {TOT }} * P M_{\text {CH4 }}$
$m_{N 2}=x_{N 2} * n_{T O T} * P M_{N 2}$
The weighing process will measure the total mass of $G 25 \mathrm{~m}_{\text {Tот: }}$ :
$m_{\text {TOT }}=m_{\text {CH4 } 4}+m_{N 2}$
$m_{\text {TOT }}=n_{\text {TOT }} *\left(x_{\text {CH4 }} * P M_{C H 4}+x_{N 2} * P M_{N 2}\right)$
but for the calculation of the energy ratio only the mass of $\mathrm{CH}_{4}$ should be used. Thus the weighing process will overestimate the mass by a factor:
$m_{\text {TOT }} / m_{\text {CH4 }}=\left(x_{\text {CH4 }} * P M_{C H 4}+x_{N 2} * P M_{N 2}\right) /\left(x_{C H 4} * P M_{C H 4}\right)$
or vice versa the measured mass must be reduced by a factor:
$c f=m_{\text {CH4 }} / m_{\text {TOT }}=\left(x_{\text {CH4 }} * P M_{C H 4}\right) /\left(x_{C H 4} * P M_{C H 4}+x_{N 2} * P M_{N 2}\right)$
According to the allowed range for $\mathrm{N}_{2}$ content, this correction factor will also vary:

- from 0.75, in case of minimum quantity of $\mathrm{CH}_{4}(0.84)$ and maximum quantity of $\mathrm{N}_{2}(0.16)$,
- to 0.8 , in case of maximum quantity of $\mathrm{CH}_{4}(0.88)$ and minimum quantity of $N_{2}(0.12)$

Thus a mean value of 0.78 can be adopted for $G_{25}$ reference fuel.
