

**Ms. Suzana Đorđević Milošević**  
**Assistant Minister, Ministry of Agriculture, Forestry and Water Management,**  
**Serbia<sup>1</sup>**

Ladies and Gentlemen,

Integrating environment into agriculture is really an issue of great importance. It's as much important as agriculture itself. Like no other sector producing negative impact on environment, agriculture which doesn't care about it is exposed to its strikes back on the daily basis. This makes it uncertain and less efficient. For agriculture natural environment is a regular business environment, its success depend on how efficient is the applied system on cheating it for obtaining more materials human use than is naturally foreseen, on the account of those human doesn't want. In that ages long game, human and its agriculture are losing its sense of complexity and tend to simplify problems. Human become violent! Can we afford it? We have to!

That is how we came to the understanding that decrease of pollution from the agriculture is the main problem of integrating environmental concern in to the agriculture. As a result of that we are look at large farms and processing facilities trying to technically solve the problem through large investments in slurry storages, expensive machinery for its distribution etc. We are trying to impose these solutions in capable and incapable countries which are struggling to survive and develop and we wonder how we can't get big results in short time. On the other side we are forgetting that we can do a lot by turning back to the basic agriculture production systems set-up and revise our approach to it in general through balancing more naturally size of farms and its structure. No one consider balancing plant and animal production, no one cares about imitation of natural processes for getting benefit anymore – agriculture becomes industry long time ago, and natural environment its factory, its production facility, premises without life and face.

On the other hand, this luxury approach for instance brought us to the point to leave old "premises" of mountains. Population is migrating leaving vast areas of arable land and grasslands to invasion of shrubs and snakes heading to lowlands for more intensive production, burdening further its resources. At the same time we are trying to protect mountains through for instance introducing new unique solution - high tourism instead of changing the structure of rural economy through its diversification. Without local communities and their traditional natural resources management practices landscape and species diversity is inevitably decreasing. Due to the absence of anthropo-zoogenic factor which helped mountains become more valuable and attractive for tourism, the whole story appears to be unsustainable in advance.

Agriculture is multifunctional, therefore complex as much as social interest for it - all activities concerning integration of environmental concern in to it should be the same, complex and integrated to include in line rising awareness and financing instruments and parallel education to provide not just sustainability of interventions but also possibility to make all of them rational and well targeted. So please don't finance individual campaigns for raising awareness if you are not going to finance interventions immediately after. We all have our troubles, farmers do too. Consequently we all tend to have amnesia. Farmers do too. Who can blame them in such uncertain

environment of production, marketing and living? Only first week manure smells, afterwards you get used to it.

Lades and gentlemen,

We don't need more strategies, fruitless discussions, speeches like this one which reminds ourselves what we know, but do nothing about. We need good examples and then immediately action, rational, step by step, targeting carefully first things we can do by ourselves, than that someone can help and finally God will help us with the rest.

Let;s go back to our work, and let us make even one small thing before we meet again. Me, myself will go back to add to the 3 years of unsuccessful offering of financial support to investments in environmental protection education and public awareness campaigns, and then also a stick ... a bit later - not to leave the carrot without protection ☺ from pests.

And remember, we don't need to integrate environment in to agriculture, agriculture is part of it, and vice versa. Agriculture is creating not just damage, but also valuable landscapes and biodiversity we want to protect. We also have to valorize better agriculture services to society, not just its products through higher prices of.

We don't need by default modernization of it in the manner of intensification, we need to balance it in space and time, somewhere to decrease yields, but to integrate production systems by going back to natural orders, somewhere we need to intensify it, but to follow outputs carefully and transform them to suitable to environment material and finally there are some places where we have to revive agriculture production for the sake of environment There is no simple solution, more models are needed, then trials-pilots, and all of them with involvement of multiple expertises, integrated approach.

"You may think its enough to bring construction engineer, and give some money to built a tank - but for Good sake you need to bring economist too, to explain me how this can help and not kill me, and then also psychiatrist to help me explain it to my wife and children, what for they have to cancel next ten years of holidays, excursions, sport shoes, why we can't by a new car and still have to borrow".

Lades and gentlemen,

We need a sheep to wear bell, we need hey to feed the sheep, and we do need its milk and meat as much as manure, just lets find a good place to store it and than way to put it back where its belong. Let us all help together, not one just warning and another rejecting and defending. We are all on the same planet, we are all in the same sh...
