Creating Enabling Environments for Health, Independence and Ageing in Dignity

Susanne Iwarsson
Professor, Director of
Centre for Ageing and Supportive Environments
Lund University
Sweden
Active & Healthy Ageing Across the Life-course

- Healthy Ageing
- Home and Community
- Bio-gerontology
- Inclusion and Participation
- Social Protection
- Unequal Ageing
- Mental Capacity
The Person-Environment Interaction

- Traditional focus on the ageing individual and population – less so on environments and person-environment interactions
- Combinations of functional limitations as related to environmental barriers result in accessibility problems
- The societal infrastructure must be accessible and enable activity and participation
- More attention to differences among EU member states is crucial
Population Diversity

- People along the process of ageing (old/very old people, but also younger cohorts)
- Persons ageing with a disability
- Third and Fourth Age = non-chronological but functional age definitions
- Demography differences across Europe
Environment Diversity

Arenas where older people primarily perform their everyday activities

- **Physical Dimensions**
  
  *Housing, neighbourhoods, public facilities, and traffic & roads in the local community*

- **Social Dimensions**

- **Cultural Dimensions**

Assistive devices intertwined with the person-environment-activity interplay
Aspects of Housing

Objective
Housing standard
Physical environmental barriers
Accessibility

Perceived (subjective)
Housing Satisfaction
Usability
Meaning of Home
Housing Control
Quantitative Studies on Home & Health

- Accessibility problems (P-E fit) are important for health – not environmental barriers per se
- Objective aspects of housing seems to be more important among those with higher functional capacity – perceived aspects more important among those with lower
- Living in more accessible housing is related to perceiving home as more meaningful and useful, less attribution of control to external factors, higher independence in daily activities, and life satisfaction
- Not only housing accessibility, but also feeling in control over one’s housing situation, is important for independence in daily activities
Qualitative Studies on Home & Health

The importance of home – for meaning, for daily activity, for independence, etc.

Differences for older people e.g. between welfare states and developing countries

Increased understanding of how people reason as concerns interventions in the home

Assistive technology is integrated with daily activities, in the home

Home has neighbourhood dimensions, too – outdoor mobility is important
“Let’s Go for a Walk!”

Pedestrian environments

*Increased accessibility/usability and safety/security for older people after implementation of measures in the outdoor environment*

*User involvement (older people)*
*Municipality, authorities, organisations involved*
*Implementation and Evaluation*

*Increased usability; less experienced problems*
*Measures appreciated, in particular by rollator users*
*Increased safety; less experienced risks*
*Still - no mobility increase; 4 years older*
Assistive Devices

Products available for people with functional limitations or/and disabilities, not any technical equipment or product designed for the general population.

Are used to:
- compensate for environmental demands, and for disability and functional decline.
- enable the person to stay independent and maintain engagement in meaningful activities and social participation, e.g. to reduce difficulties and limitations in everyday activities.
Complexity
Impact on activity & participation
Changes over time
Combinations of devices
Adaptation of physical environment
Adaptation of task performance
“I wouldn´t manage very well without the rollator, I´m sure of that. I must have……the rollator is absolutely essential for me, I can use it for a lot of things, not just walking.”
Summary

• More attention to health promotion and prevention based on a better understanding of person-environment dynamics
• Knowledge and actions going beyond housing and health care concerns
• Focus on the role of local neighborhoods
• Mobility is a key factor to activity, participation and health
• Remember that more people will live longer with chronic diseases – ageing with disability is a challenge for the future
• More attention to European cross-national diversity
