Session 1: What are two concrete takeaways worthy of further collective efforts?

• Role of NSIs beyond their normal remit to support the data ecosystem.
• NSOs offer rigour and quality to partners. These features have to be preserved to remain trustworthy.
• The value of partnership and it is an investment that takes time and effort and alignment of values. The importance of working in the system to build capability.
• 1) Develop a common narrative around the critical importance of NSOs stepping into the Data Stewardship role; 2) Defining the minimum set of core responsibilities for a Data Steward leaving space for additional roles relevant nationally.
• Great tool by CBS to classify web industries. Collaboration is easy(ier) when priorities aligned!
• Great partnership between CBS and Dataprovider that we could develop in other countries on a common use case.
• More sharing of good practices.
• We need to develop concrete action plan for supporting larger data ecosystem.
Session 1: What are two takeaways that are highly unlikely to work in your country context?

• Not stepping up into the role of a data steward for the Civil and Public service !!!
• How NSO should treat democratic process in making strategy?
Session 2: What are two concrete takeaways worthy of further collective efforts?

• Australia’s example shows that a national system can be over complicated, possibly because its trying to be all things for all departments. Perhaps this demonstrates that we must take a leadership role.

• While org structure can be complex, figuring each and everyone's role and responsibility is important! There may be a need for a stat authority group in all countries, a body that sit outside the NSO.
