Migrant-specific use of the Labour Force Survey - Immigrants

UNECE - EUROSTAT
CONFERENCE OF EUROPEAN STATISTICIANS
Work Session on Migration Statistics
Geneva, Switzerland

Zsófia Szikráné Lindner
Hungarian Central Statistical Office

18-20 May 2016

Long term goal: To develop statistics on integration of third-country citizens*

Goal of the project: To supply core indicators on employment of third-country citizens

Recommendation of Eurostat: source = Labour Force Survey (LFS)

LFS in Hungary: small number of third-country citizens are included in the sample

due to: low rate within the population → 0.6%

specific regional distribution → 59% live in Budapest

lower willingness to respond

In order to supply indicators of foreigners some methodological developments are needed

Project: to carry out a survey on third-country citizens
(separate sample, migrant-specific questionnaire and data collection techniques)

Preparation – Methodological developments (May 2013 – Marc 2014):

1. To elaborate self-responded questionnaires of LFS and translate it into 5 foreign languages
2. To develop appropriate data collection techniques for effective questioning migrants
3. To ensure special training and manual for interviewers
4. To work out special sampling and weighting schemes for foreigners

**Survey on third-country citizens was carried out
in 2nd quarter, 2014**

Questionnaire used

Main aspects: To prepare a questionnaire that is easy to fill in good quality
To gain comparable data with LFS

1. To turn questionnaire of LFS into self-responded one

Alterations on the basic questionnaire of LFS:

- Shortening and simplifying the questionnaire
- Questions were put into a more transparent structure
- Adding explanations and definitions of some notions
- Transforming open ended questions into closed ones
- Rephrasing questions and responds considering features of the target group

2. Translating the transformed questionnaire (English, Russian, Chinese
Vietnamese, Arabic)

3. Ad hoc module (2nd quarter, 2014): about integration of migrants and their descendants
- Translating the ad hoc modul into 5 languages

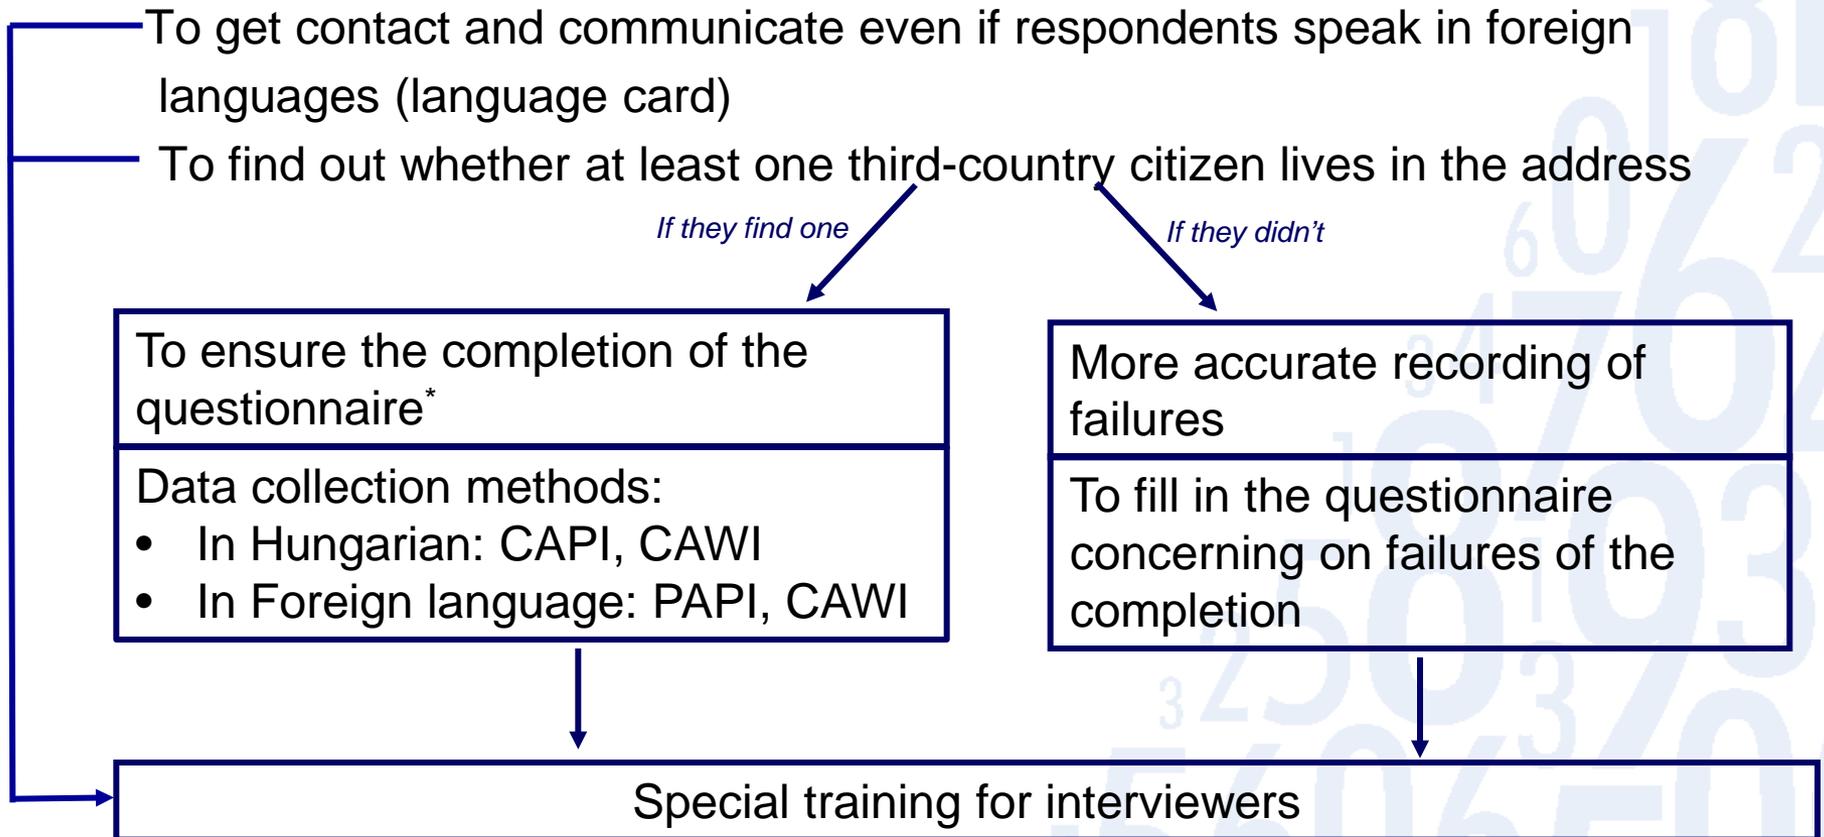

Basic questionnaire → about demographic and economic activity characteristics

Ad hoc modul → about overqualification, main obstacles in the labour market

Data collection technique, education of interviewers

Self-responded questionnaire but the contribution of interviewers was needed
Their duties – detailed guidelines:

*Mainly interviewers of LFS were selected

CAPI: Computer Assistant Personal Interviewing
CAWI: Computer Aided Web Interviewing
PAPI: Paper and Pencil Interviewing

Sample on third-country citizens

Purposes of the survey besides providing employment indicators:

- to find out if the sampling frames are suitable to find the third-country citizens
- to estimate the size of the target population

Sampling frames:

Data sources on addresses of third-country citizens

Census (2011): 19 thousands addresses

Population Register* (Nov, 2013): 28 thousands addresses

Register of Foreigners** (Nov, 2013): 84 thousands addresses

The union of the three frames: 103 thousands addresses

4 thousands addresses were selected

Sampling scheme: Based on addresses

One stage stratified selection

Within the strata the allocation was proportional

* Central Office for Administrative and Electronic Public Services

** Office of Immigration and Nationality

Reliability of the sampling frames and weighting

- Main difficulty during sampling: addresses were stored inaccurate and in diversified ways → duplications on addresses
So it was difficult to identify the identical addresses
- Assessed the reliability of sampling frames → errors of the sampling frames
Proportion of addresses where third-country citizens can be found:
 - Census, 2011: 45 %
 - Population Register: 42 %
 - Register of Foreigners: 31 %
- Weighting were determined by the sampling design and selection
Further actions* were carried out during weighting:
 - Handling the duplications on addresses
 - Handling the errors of the sampling frames
 - Compensating the cases where data collection failed
 - Combining the weights of sub-samples

*Calibration was not carried out, we also estimate the size of the target population

Outcomes of the survey on address level

Realization	Number of cases	Distribution
		(%)
All cases	4 014	100
→ Completed	565	14,1
Refusal	432	10,8
Non-contacted household	659	16,4
Language problem, unable to response	29	0,7
→ Errors of samling frames	2 329	58,0
Of which:		
Lack of targeted person	1 642	40,9
Other errors of samling frames (vacant housing unit, no housing unit, unable to locate the address, etc.)	687	17,1

Respond rate without taking into account the errors of the sampling frames:
34 %

Among 4014 addresses the survey was carried out successfully in 565 cases:
Estimation: 25 200 private addresses* where third-country citizens live

*Migrant population living in institutions was not part of the survey

Estimation on the size of target population, fitting of results

Totally 931 third-country citizens answered the questionnaire

Estimation: 40 thousands third-country citizens living at private addresses

Official statistics, (1 Jan, 2014) → total number of third-country citizens is 60 thousands persons

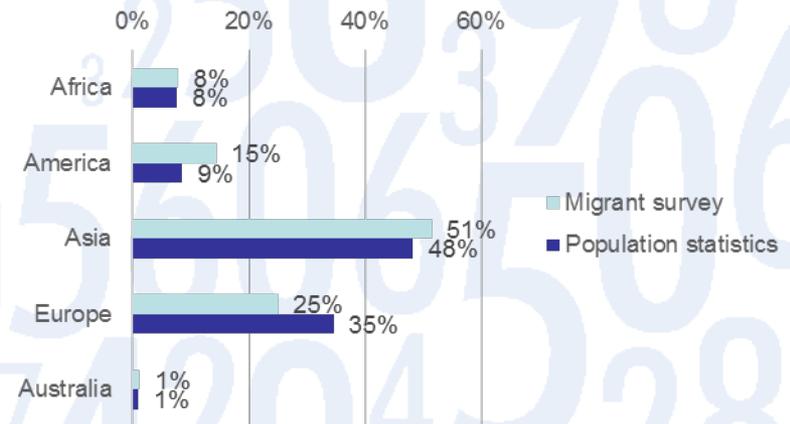

Reasons of undercounting can be: Only private addresses were taken in consideration
 Inaccurate addresses, movements of foreigners
 Difficulties on reaching them, distrustful behaviour

Although of the underestimation of size, the distributions of survey fit well to official statistics based on administrative sources:

According to both statistics

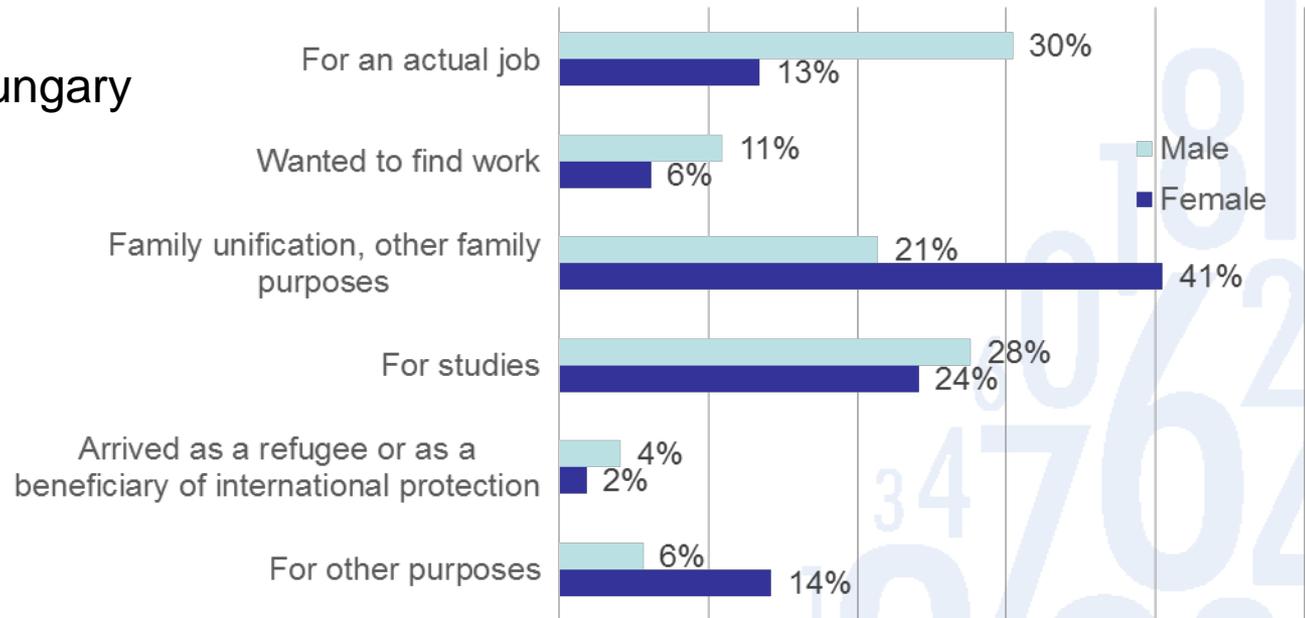

- Males are overrepresented among migrants
- Younger age structure than natives
- Proportion of Asians is the highest →
- The most important countries of origin:

China, Ukraine, Russia,
 Vietnam, United States, Serbia

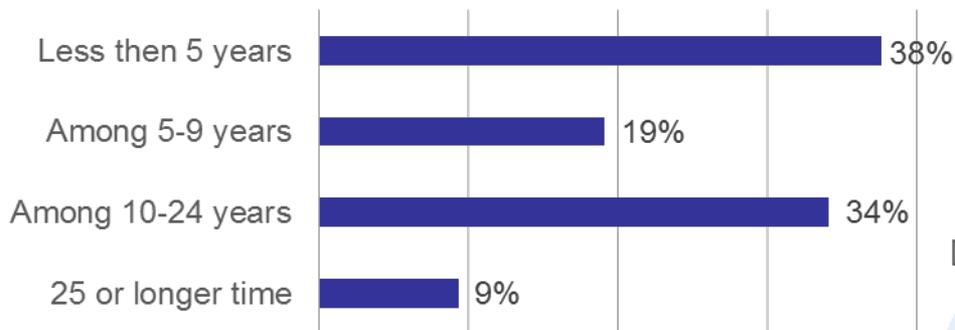

Characteristics of the target population known from the migrant survey

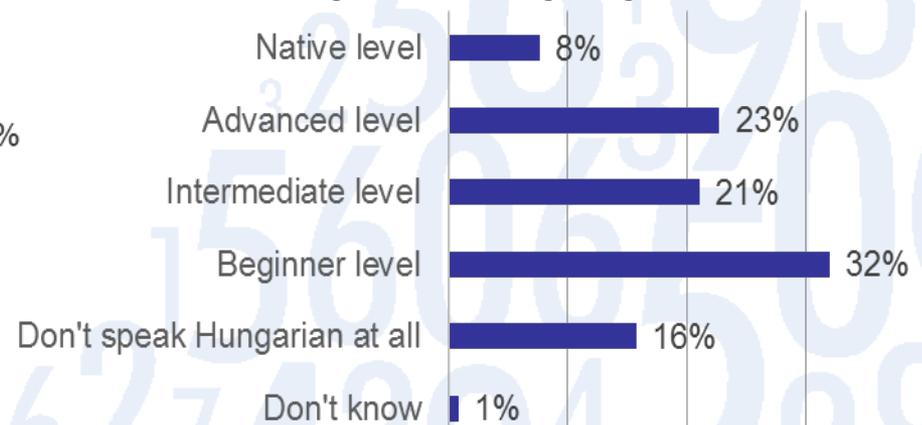

Reason of arriving in Hungary (among 15-74 year-olds)

Length of stay in Hungary

Level of Hungarian language skills

Labour market indicators, 2nd quarter 2014

8.1 %

84.9 %

78.8 %

7.2 %

The overall difference between the migrant and domestic population is mainly due to the different demographical structure of the two groups!

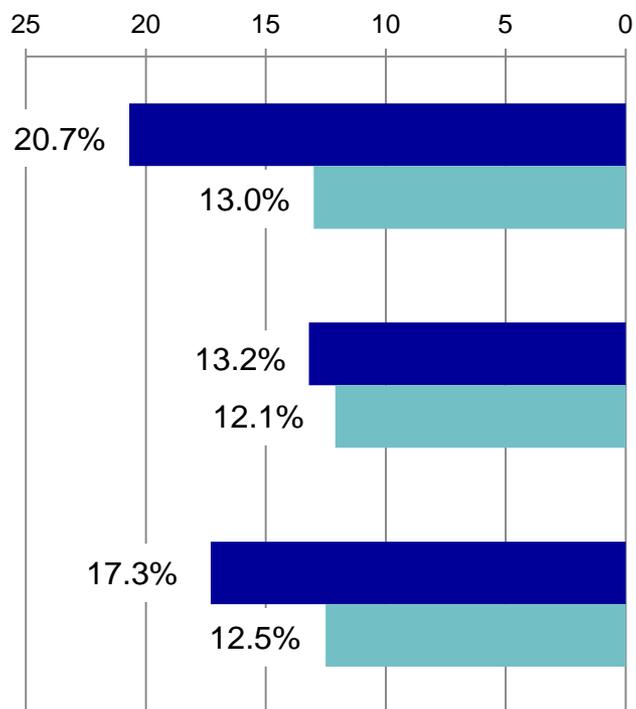

Third-country citizen females are in less favourable situation than Hungarian females:

- Their employment rate is lower
- Their inactivity rate is higher
- Their disadvantage compared to males is higher

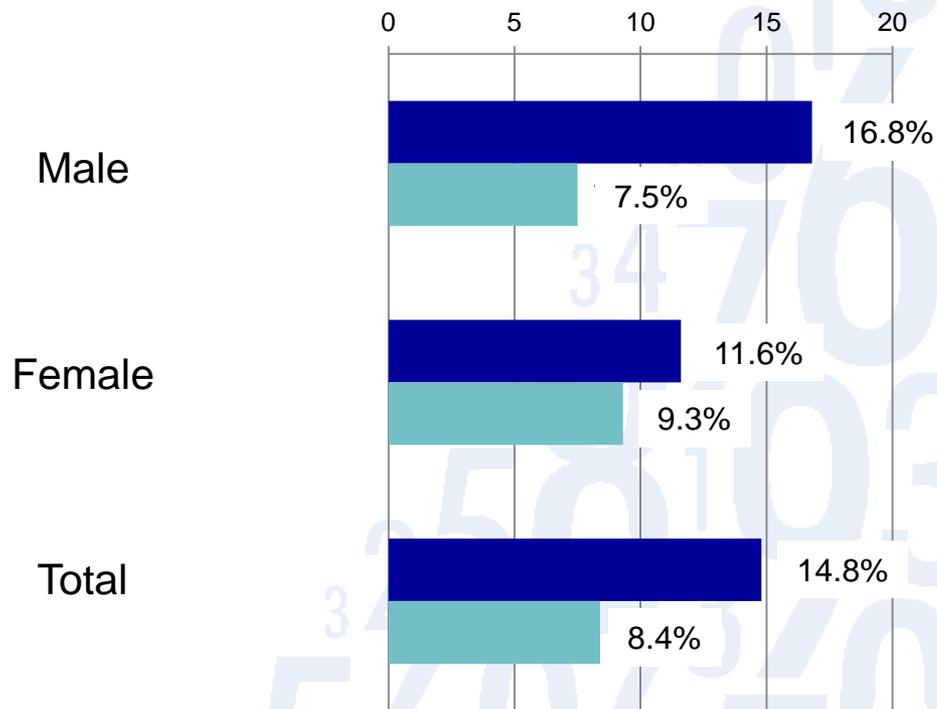

Overqualification

■ Third-country citizens
■ Hungarian citizens

Objective

Subjective

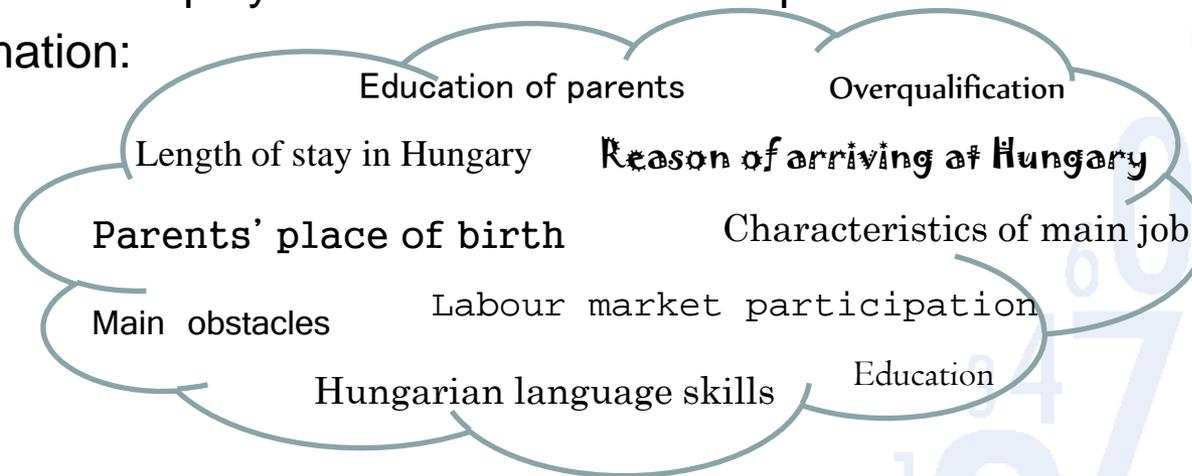

Employees with higher education having a job which requires low or medium level of qualification (%)

Employees considering themselves overqualified (%)

Main results

More precise information about the integration of third-country citizens

- Core indicators on employment which can be compared to natives' one
- Further information:

New information about the reliability of addresses derives from various databases.

Interviewers gained experiences about interviewing migrants which can be also utilized in regular household surveys.

Methodology of the migrant survey can be used in the future.
