CONFERENCE OF EUROPEAN STATISTICIANS

Group of Experts on Consumer Price Indices

Eighth Meeting
Geneva, 10-12 May 2006
Item 8 of the provisional agenda

**STRUCTURED PRODUCT DESCRIPTIONS AND THE RELATIONSHIP BETWEEN
PURCHASING POWER PARITIES AND CONSUMER PRICE INDICES*¹**

Submitted by Eurostat and OECD

The meeting is organised jointly with the International Labour Organization (ILO)

I. INTRODUCTION

1. This paper describes the structured product descriptions (SPDs) for consumer goods and services that are being developed by Eurostat for the Eurostat-OECD Purchasing Power Parity (PPP) Programme and compares them to the SPDs used in the International Comparison Programme (ICP). SPDs can be seen as another level of detail of COICOP which is one of the classifications underlying the PPP Programme. COICOP is also the classification underlying the Harmonised Index of Consumer Prices (HICP) for which the HICP Programme is currently developing additional levels of detail, namely, the “sub-class” and the “consumption segment by purpose”. Of these, the consumption segment is the most important, one of its objectives being to provide countries with guidance for sampling. The paper compares the two developments and

* The present document was submitted after the 10-week deadline for operational reasons.

¹ This paper has been prepared by Mr. Paul Konijn (Eurostat) and Mr. David Roberts (OECD) at the invitation of the secretariat.

considers possible synergies between them. When reading the paper it is important to remember that the SPDs and the consumption segments are still work-in-progress. No decisions have been taken as regards the implementation of COICOP sub-classes and consumption segments for HICP purposes.

II. STRUCTURED PRODUCT DESCRIPTIONS

2. “Structured product description” is the name given by the Global Office of the International Comparison Programme (ICP) to the check lists prepared to help regional co-ordinators establish the basket of comparable and representative consumer products to be priced in their region. These check lists or SPDs are generic product descriptions that list the technical and economic characteristics that the products constituting a product cluster may possess. They also list the types of outlet at which products from the cluster may be found and the types of outlet at which they are most commonly sold. Product clusters usually cover a narrow range of homogeneous products that have some variation in their common set of characteristics nonetheless. Rice, bread, men’s shirts, personal computers, transport services and personal care services are examples of product clusters.

3. The SPD for rice is shown in Table 1. The characteristics listed and the various combinations they offer make it possible to describe different varieties and types of rice, their origin, their packaging and quality, and their points of sale. For example: white long-grain rice, imported, in a fully-labelled carton box of 500 grams with little or no broken rice, found mainly in supermarkets; white medium-grain rice, imported, in an unlabelled plastic bag of 1000 grams with a share of broken rice below 50 per cent, sold mainly in supermarkets and neighbourhood shops; brown short-grain rice, domestically-produced, sold loose with a share of broken rice above 50 per cent, available at open markets and neighbourhood shops; etc.

4. The SPDs were sent to countries participating in the ICP by the regional coordinators. The SPDs provided countries with the means to record and report the characteristics of the consumer products on their market in a systematic and comparable way. When completing a SPD, countries are identifying a specific product and distinguishing it from the other products in the cluster. In doing so, they are also specifying the product. By matching the completed SPDs returned by countries, regional co-ordinators were able to determine which products were common to at least some countries in the region and were therefore to be included on the regional product list. The product specifications for the products on the product list were taken from the matched SPDs.

5. The initial templates for the SPDs were the check lists that the US Bureau of Labour Statistics (BLS) had prepared for the product clusters making up its consumer price index (CPI). Although the two check lists remain similar for product clusters common to both the CPI and the ICP, they are not exactly the same as the SPDs had to be modified to take account of characteristics that are relevant outside the United States. Hence, the SPD for rice in Table 1 makes no mention of whether the rice is pre-cooked or uncooked, nor does it mention organic certification. On the other hand, it includes additional information on labelling, origin, the share of broken rice and whether the rice is sold packed or loose.

Brand

Other Item Features

Other Item Identifiers

6. Not all the BLS product clusters - like those for medical services - were suitable for ICP purposes and the Global Office had to develop SPDs for such product clusters itself. It also had to develop SPDs for product clusters not covered by the CPI. Animal drawn vehicles and clothing items such as saris and sarongs are but two examples. It was assisted in this by the regional co-ordinators who themselves were aided by the participating countries of their region. The eventual refinement and finalising of the SPDs was an iterative process.

7. The SPD approach is a top down approach with the SPD defining the characteristics of the product cluster by which the products selected for pricing from the cluster are to be identified and specified. The approach is not limited to consumer goods and services. The Global Office subsequently prepared SPDs for capital goods as well. Nor is it limited to spatial price comparisons within regions, it could be used to identify and specify products for temporal price comparisons within a single country. The SPD approach accommodates the application of hedonic methods.¹ In this case, the SPDs also serve as price collecting forms.

III. EUROSTAT AND SPDS

8. Soon after the start of their joint programme in the early 1980s, Eurostat and the OECD began structuring the product specifications used in their price surveys with the objective of having specifications for products from the same product cluster formulated in the same way. In other words, the idea of a SPD was always there even if it was not called SPD. Until 1999, the rigour with which this objective was pursued varied from survey to survey and from round to round. Even so, a common understanding about the characteristics of the products to be priced was ensured by all participating countries meeting before each survey to discuss the product list.

9. In 1999, the number of countries participating in the Eurostat comparison rose from 20 to 31. Co-ordinating 20 countries as a single group had proved to be difficult and possibly detrimental to the comparison. The 31 countries were divided into three groups. Each group would collect prices according to a common set of guidelines and following a common timetable, but each group would have its own product lists. Even so, regardless of group, countries would continue to be compared at the product level through overlap products – that is, products that appeared on the product lists of more than one group. The development of SPDs would ensure that products from the same product cluster would be specified the same way on all three product lists. It would also make the identification of overlap products easier.²

10. SPDs contain a standard list of characteristics that are used to describe a product cluster. Each basic heading - that is, the elementary aggregate of a Eurostat-OECD comparison and which is essentially either a product cluster or a group of product clusters (see next section) - can include one or more SPDs. For example, for the basic heading “fresh and chilled vegetables“, there is only one SPD – “fresh and chilled vegetables” - but for the basic heading “coffee, tea and cocoa”, there are three SPDs – “coffee”, “tea” and “cocoa”. Each of these SPDs lists the characteristics that should be used to describe the cluster of products to be priced. In this way, the SPDs introduce an additional, more detailed, classification level.

11. Product specifications are formulated by allocating a value to the characteristics listed on its SPD. Hence, in the SPD for rice, possible values for “type” could be “long grain”, “whole

grain", etc. It is not necessary that all characteristics forming an SPD have to be used for each product definition under this SPD. In other words, the value for such characteristics would be either "not applicable" or "null". This approach ensures the right balance between the complexity of a SPD - that is, the number of characteristics - and the number of SPDs.

12. The introduction of SPDs has a number of advantages. The first is that the creation and management of product lists will become easier and better organised. In this it will be assisted by the development of new software specifically for this purpose. The second is that the possibilities for validation and analysis of price data will be improved. For example, validation of current survey results could be made better by a systematic comparison with previous survey results, but this can only be achieved if information is stored in a way that allows identical items to be compared across countries and over time. The third advantage is that SPDs will be helpful when translating product lists from English into national languages before price collection because the translations of their standard formulations of characteristics can be stored in a database. In the past, when product specifications were more or less "free text", translation required significant resources.

13. The Eurostat approach to developing SPDs is different to that of the Global Office in as much as it is a bottom up rather than a top down approach. It begins by analysing the characteristics specified in product specifications that have been used in previous price surveys for a basic heading. The analysis allows the products specified in the product specifications to be divided into clusters of products having similar characteristics. These characteristics are then combined in a SPD. The intention is that, the next time the basic heading is surveyed, the product specifications for the products to be priced will all be specified in line with the SPDs for the basic heading.

Table 2: Eurostat-OECD PPP Programme - Proposed SPD for rice

Basic Heading		11.01.11.1 Rice
SPD		11.01.11.1.01 Rice
Product	Code	
	Name	
Properties	Brand/brand type	
	Group	
Characteristics	Type	
	Parboiled	
	Cooking time	
	Quantity	
Exclude		
Price for		
Specify		

14. Table 2 shows the SPD currently proposed for rice. It is simply a form designed to describe a product that is to be priced. It starts with a code and name for the product. Then there are some "properties" that are valid for all products in all SPDs - that is, brand/brand type³ and country group that prices this product⁴. Then there is the list of the "characteristics" that are specific to this SPD. Some of the characteristics may be "free text", in the sense that there is no restriction to the way the value of the characteristic is described. Other characteristics could be "multiple choice" (as they are in most ICP SPDs), thus allowing only certain values. Finally, there are some generic fields: "exclude" is used to indicate specific types of products that are not to be priced, "price for" indicates the measurement unit for which a price is to be collected and "specify" refers to the characteristics of which the value is to be collected by the price collector.

15. Table 3 gives examples of draft product specifications using the SPD for rice⁵. Each column refers to one product to be priced.

16. The matrix presentation of product specifications in Table 3 helps to produce high quality and consistent definitions. For example, it can be seen immediately which characteristics have not yet received a value (if one is needed) and whether the selection of products is representative for the SPD concerned (for example, in terms of shares of brand types). Moreover, the web-based product list management tool being developed by Eurostat allows country group leaders to see the product proposals of other groups at any stage of product list development; thereby promoting the identification of a core of overlap products between the group product lists in an efficient way at an early stage.

17. The SPDs as they stand now have been derived from the product specifications used in previous surveys. From now on, the SPDs will evolve with each survey. The creation of the product list for each survey will include a review of the SPDs leading, for example, to new characteristics being added. The SPDs are expected to be more stable over time than the product specifications themselves in as much as characteristics will stay the same but their values will change.

18. Both the ICP SPDs and the Eurostat SPDs refer to a "heading" – an "ICP heading" in Table 1 and a "basic heading" in Table 2. A heading is essentially a product group which, depending on its homogeneity, may contain one or more product clusters. A heading or product group does not exist in a vacuum. It is distinguishable from other headings or product groups all of which constitute a level of detail in a classification of a higher level aggregate. The aggregate in the case of the ICP and the Eurostat-OECD PPP Programme is household final consumption expenditure or individual consumption expenditure of households.

IV. COICOP

19. The classification underlying the classifications of individual consumption expenditure of households used by the ICP and the Eurostat-OECD PPP Programme is COICOP⁶. COICOP is also the classification on which the classification of household final monetary consumption expenditure⁷ used for the HICP is based.

20. COICOP classifies individual consumption by purpose. It has three levels of detail: division (or two-digit level), group (or three-digit level) and class (four-digit level) three. There are 14 divisions. Divisions 01 to 12 cover the individual consumption expenditure of households, and divisions 13 and 14 cover respectively the individual consumption expenditure of non-profit institutions serving households and the individual consumption expenditure of general government. COICOP is generally used to classify the individual consumption expenditure only so divisions 13 and 14 are rarely, if ever, referred to. Table 4 shows the distribution of COICOP groups and COICOP classes over divisions 01 to 12.

21. COICOP classes are too broad for some purposes and need to be broken down further.⁸ For the ICP and the Eurostat-OECD PPP Programme, COICOP classes are broken down at the five-digit level into basic headings. “In theory a basic heading is defined as a group of well-defined goods and services”, although “in practice it is determined by the lowest level of final expenditure for which explicit expenditure weights can be estimated”.⁹ This further sub-division of COICOP classes is referred to here as COICOP-PPP. The ICP version is less disaggregated than the Eurostat-OECD version having 108 basic headings instead of 146 as shown in Table 4.¹⁰

22. For the HICP, Eurostat recently produced a first draft of a proposal to break down COICOP classes into sub-classes at the five-digit level and into consumption segments at the six-digit level¹¹. There is a close correspondence between the five-digit level basic headings of COICOP-PPP and the draft proposal for five-digit level sub-classes of COICOP-HICP in as much as the sub-classes are further disaggregation of the basic heading and do not cut across basic headings. For example, the basic heading “other cereals, flour and other cereal products” is broken down into three sub-classes: flour and other cereals, breakfast preparations and other cereal products.

23. Consumption segments (or consumption segments by purpose) can be seen as narrowly-defined product clusters comprised of products that “on the ground of common properties are deemed to serve a common purpose, in the sense that they are purchased for predominant use in similar situations, purchased with similar ends in mind of consumers and perceived by consumers as being similar”¹². Because of the close correspondence between the five-digit level basic headings of COICOP-PPP and the five-digit level sub classes of COICOP-HICP, there is generally a good correspondence between the five-digit level basic headings of COICOP-PPP and the six-digit level consumption segments. There are two notable exceptions however, the basic headings and consumption segments covering motor cars and the basic headings and consumption segments covering restaurants, café and the like. The treatment of sports footwear also differs.

24. Table 4 also gives the distribution of SPDs. It shows that there are considerably more consumption segments than there are SPDs. There are two reasons for this. The first is that when a sub-class is broken down into consumption segments the whole universe of products covered by the sub-class is covered, but SPDs are based on the specifications of products selected to reflect the principal expenditures on the basic heading rather than the coverage of the basic heading. The second reason is that it is not necessary to have a SPD per consumption segment. For example, the COICOP class “wine” is broken down into ten consumption segments, but the same SPD – that is, the SPD for “wine” – can be used for all of them.

25. Details of the correspondence between COICOP classes, COICOP-PPP basic headings, COICOP-HICP sub-classes and consumption segments, and SPDs are given in the Annex. The correspondence between consumption segments is not exact.

V. CONCLUSION

26. Both the PPP Programme and the HICP Programme are concerned with the pricing of comparable products. The two programmes also have a spatial dimension and a time dimension, although the emphasis differs between them. Synergies between the two programmes that may arise from the development of consumption segments and SPDs are therefore of interest. For example, a review of consumption segments by basic heading could identify important gaps in the PPP price collections and the need for more SPDs. These SPDs could be based on an analysis of the product specifications that countries use for their CPIs. In addition, the SPDs could be useful to CPI price collectors in describing the products they have found and priced in the various outlets. A systematic collection of such product descriptions underlying the CPIs would give enormous analytical possibilities and would enhance the possibilities of convergence of PPP and CPI/HICP price collections, each of them requiring significant resources and currently maintained in parallel. This would of course imply a major organisational challenge to the existing national CPI and PPP data collection systems.

27. It was said at the beginning of the paper that “the SPDs and the consumption segments are still work-in-progress” and any conclusion can only be tentative. Clearly, if the two programmes are to benefit from the possible synergies mentioned in the paragraph above, they will need to work closely together.

NOTES

¹ See, for example, “Interarea Price Comparisons for Heterogeneous Goods at Several Levels of Aggregation”, M. Kokosky, B. Moulton and D. Zieschang, in *International and Interarea Comparisons of Income, Output and Prices*, edited by A. Heston and R. Lipsey, National Bureau of Economic Research, *Studies in Income and Wealth*, Volume 61, Chicago University Press, 1999.

² After 1999 there was undoubtedly a much stronger incentive to develop SPDs than before, but there was also the means with the development of suitable software. Moreover, with the need to translate specifications into over twenty languages, the way they were drafted also changed, from sentences to short phrases, making it easier to analyse and correlate them.

³ A named single brand or named multiple brands, or unspecified well-known brands, or brandless.

⁴ Central (C), Northern (N) or Southern (S) group.

⁵ These are imaginary examples, but close to reality.

⁶ “Classification of Individual Consumption According to Purpose (COICOP)”, *Classification of Expenditure According to Purpose*, United Nations, New York, 2000. COICOP is an integral part of the 93 SNA and the 95 ESA, but it is also intended for use in other statistical areas such as household budget surveys, consumer price indices and international price and volume comparisons of GDP. It follows the concepts and definitions of the 93 SNA and the 95 ESA. These concepts and definitions are not necessarily appropriate for other applications and will need redefining if they are not.

⁷ Excludes imputed expenditure such as rentals of owner occupiers and FISIM. Also excludes monetary expenditure on narcotics, animal drawn vehicles, games of chance, prostitution and life insurance.

⁸ Occasionally they are too narrow. COICOP-PPP sometimes merges classes. For example, COICOP has five classes covering insurance – life insurance, house insurance, health insurance, motor vehicle and travel insurance, and other insurance. In COICOP PPP they constitute a single basic heading.

⁹ “Appendix VII: Glossary of terms and abbreviations”, *PPP Methodological Manual*, Eurostat and the OECD, Luxembourg and Paris, 2005.

¹⁰ Originally COICOP-PPP – *COICOP PPP*, OECD, 1999 – had 199 basic headings, but this was reduced to 146. There were two reasons for this. The first was because with the increase in participating countries consumption patterns became more varied and made it more difficult to select products that were both representative and comparable for narrowly-defined basic headings. The second was because the more detailed the breakdown of household final consumption expenditure – that is, the more basic headings there were – the more difficult it was for participating countries to estimate expenditure weights.

¹¹ As said in the introduction, no decisions have been taken as regards the implementation of COICOP sub-classes and consumption segments for HICP purposes.

¹² “Draft Commission regulation amending Articles 2, 4 and 5 of Commission Regulation (EC) No 1749/96”, Room document HCPI 04/500-rev.6, *Working Group Harmonisation of Consumer Prices*, Luxembourg. 7-8 December 2005.
