

ARGOS[®] – a high accurate wayside train monitoring system

Hottinger Baldwin Messtechnik - the Global Market Leader

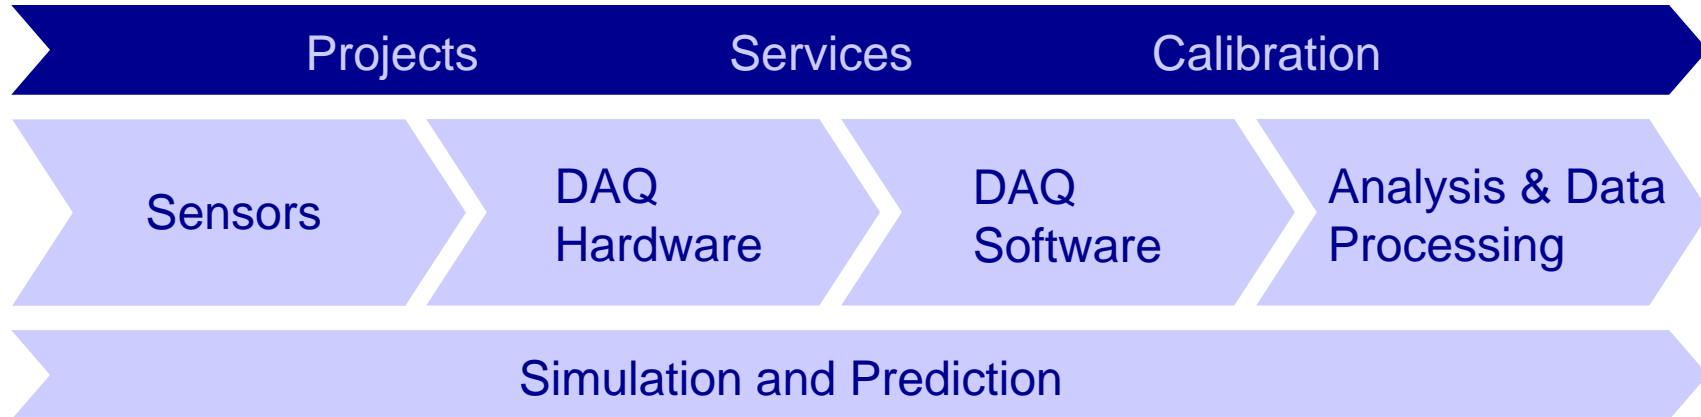

- 60 years experience
- 1,700 employees
- 6 engineering sites
- 26 sales locations
- Represented in over 50 countries by 33 independent distributors
- 140 developers
- Over 4,000 products

measure and predict with confidence

Competence from Physical Measurement to Virtual Testing

measure and predict with confidence

Typical HBM railway applications

- Argos[®] System
- Asset health monitoring (especially bridges)
- R&D infrastructure components (e.g. switches)

measure and predict with confidence

Argos® – a high accurate measurement solution

1998: initial research started and driven by

2006: out of the box modular
standardised solution

Reasons for “wayside anti-derailment devices”

SAFETY:

Prevent accident

Hot Box detection
Bearing and Break

Derailment
detection
Arglos® Level 1

Fire detection
Train gauge
Monitoring

Over loading,
Unbalanced load,
Instability
Arglos® Level 2 & 3

Sensors are connected with the signaling system: Alarms stop the train!

Reasons for wayside train monitoring systems

Economical

Enhancement of vehicle durability

Cost optimization and infrastructure protection

Permanent, centralized rolling stock monitoring and technical traffic check prevention

Argos[®] measured wheel-rail parameters

- Quasi-stationary vertical forces and loads (Q)
- Dynamic vertical forces and loads
- (derived quantities like axle side to side difference etc.)
- Quasi-stationary lateral forces and loads (Y)
- Dynamic lateral forces and loads
- Quasi-stationary longitudinal force (T)
- Wheel out-of-roundness

= all rail-wheel force parameters

The Argos® approach

- Sensors integrated in the infrastructure
- Mounting on all track types possible
- No influence on the track maintenance
- Measurements on regular track speed (typical 20 up to 300 km/h)
- Best possible accuracy (better 1,5% on track speed)
- Near real-time measurement results (typical less than 5s)
- No vehicle type limits
- No sensors on the vehicle are necessary (but possible e.g. RFID-Tags)

The Argos[®] approach

Level 1 –
Derailment
detection

**after
derailment**

risk and cost
reduction

Level 2 –
straight line
train control

Level 3 –
train control and
derailment safety

Prevention

Cost reduction

Argos® Level 1- Derailment Detection

Features Level 1

1. Simple principle, well developed technology
2. For all types of concrete, wooden sleepers
3. Easy mounting
4. All rail mounting elements are free visible
5. All derailment situations to be detected
6. No influence on track maintenance

Argos[®] Level 2 - Automatic Train Control

Detection of risk factors caused by:

- Wheel load (force) variations
- Wheel defects

Sensors taking over responsibility

April 3, 2012

12

Argos[®] Level 2 - Examples

measure and predict with confidence

Argos® Level 2 - Examples

Argos® Installation with machine support

April 3, 2012

15

Argos® Quasi-stationary vehicle over loadings

in Europe:
22.5t max.
allowed axle
load

April 3, 2012

17

What accuracy do we need?

Example old Bridge in Austria: Max allowed axle load is 25t (strict limit)

Allowed axle load on the track 22,5t

Measured with +/- 10% accuracy class

Vehicles with 22,75t axle load have to stopped

This is not practicable

Measured with +/- 1,5% accuracy class

Vehicles with 24,62t axle load have be stopped

This is practicable!

Wheel defects

Argos® Modul „wheel shape irregularities“ measurement principle

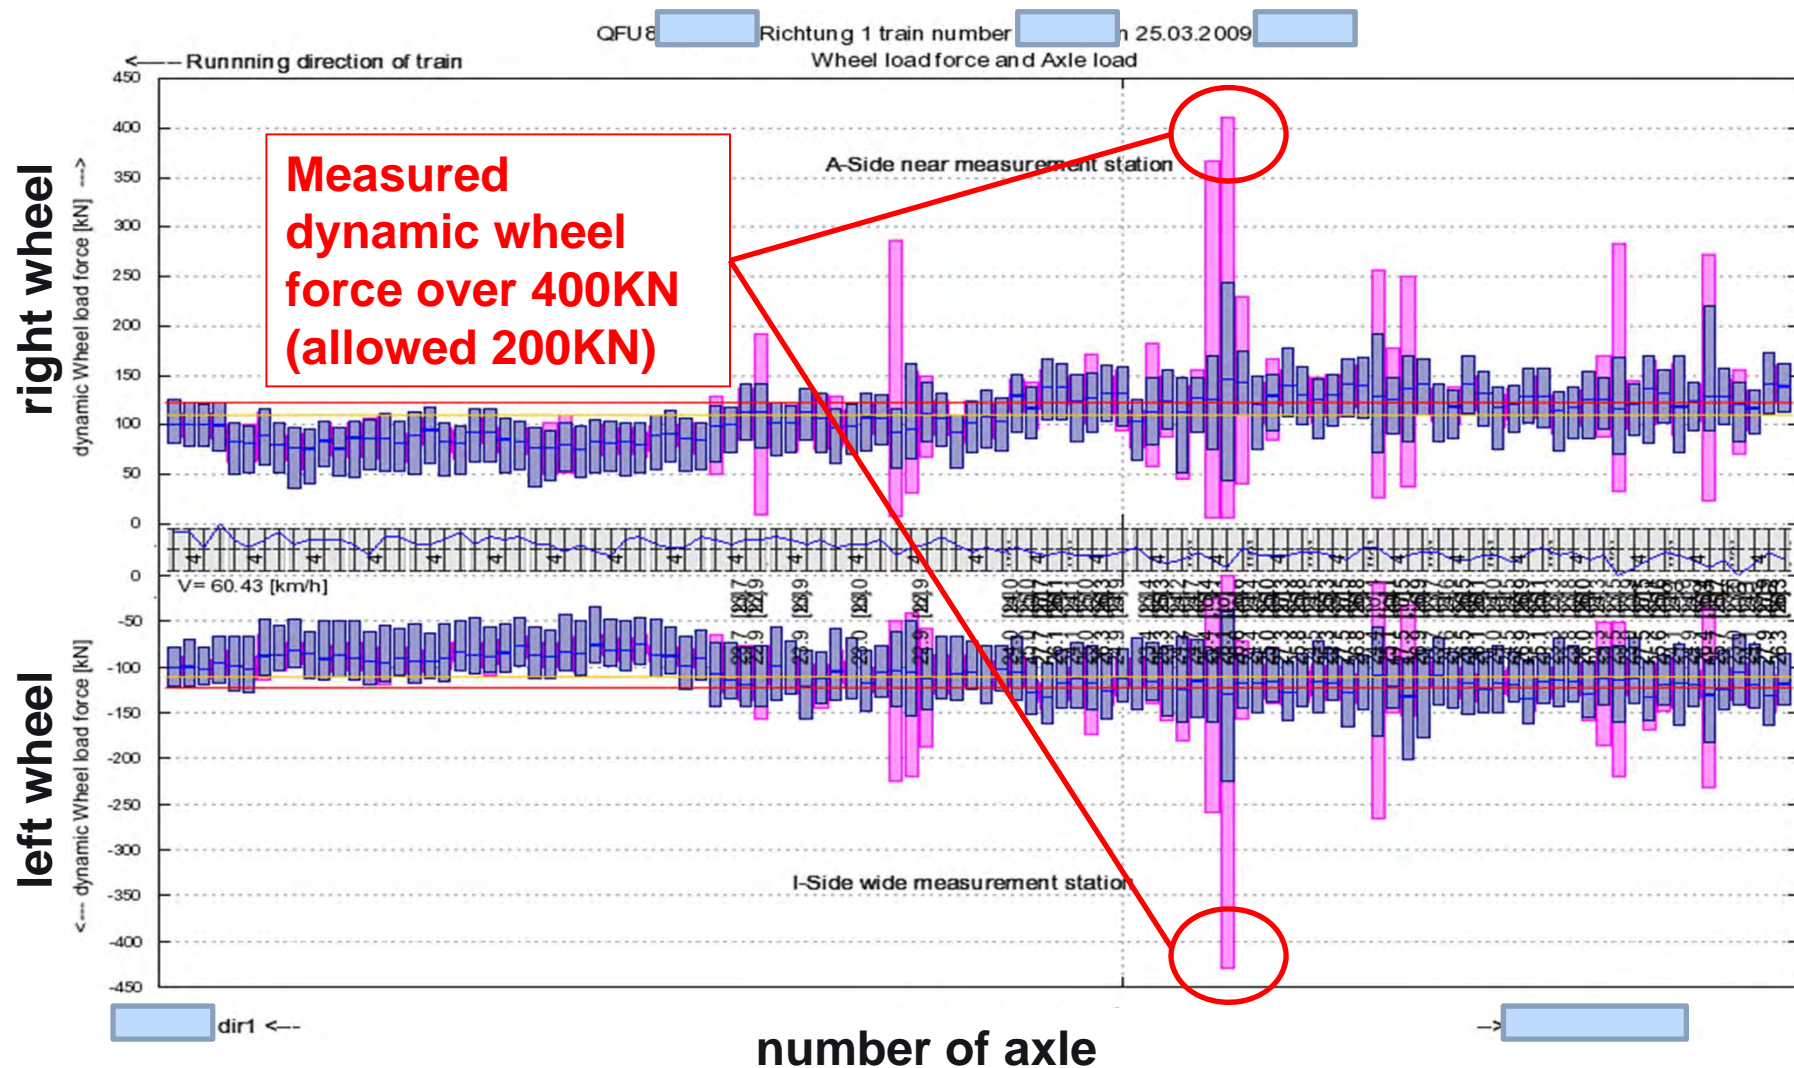

special engineered accelerometers

EP 1883 565: The signals are derived from the measuring elements, which displace the rails in the vertical direction and, then an information array is formed in the evaluation device from the signals, which corresponds at least to the periphery of the wheel. The periodic signal of the shapes of the wheel is evaluated with the aid of a Fourier development

Argos[®] Dynamic wheel Q-force

April 3, 2012

21

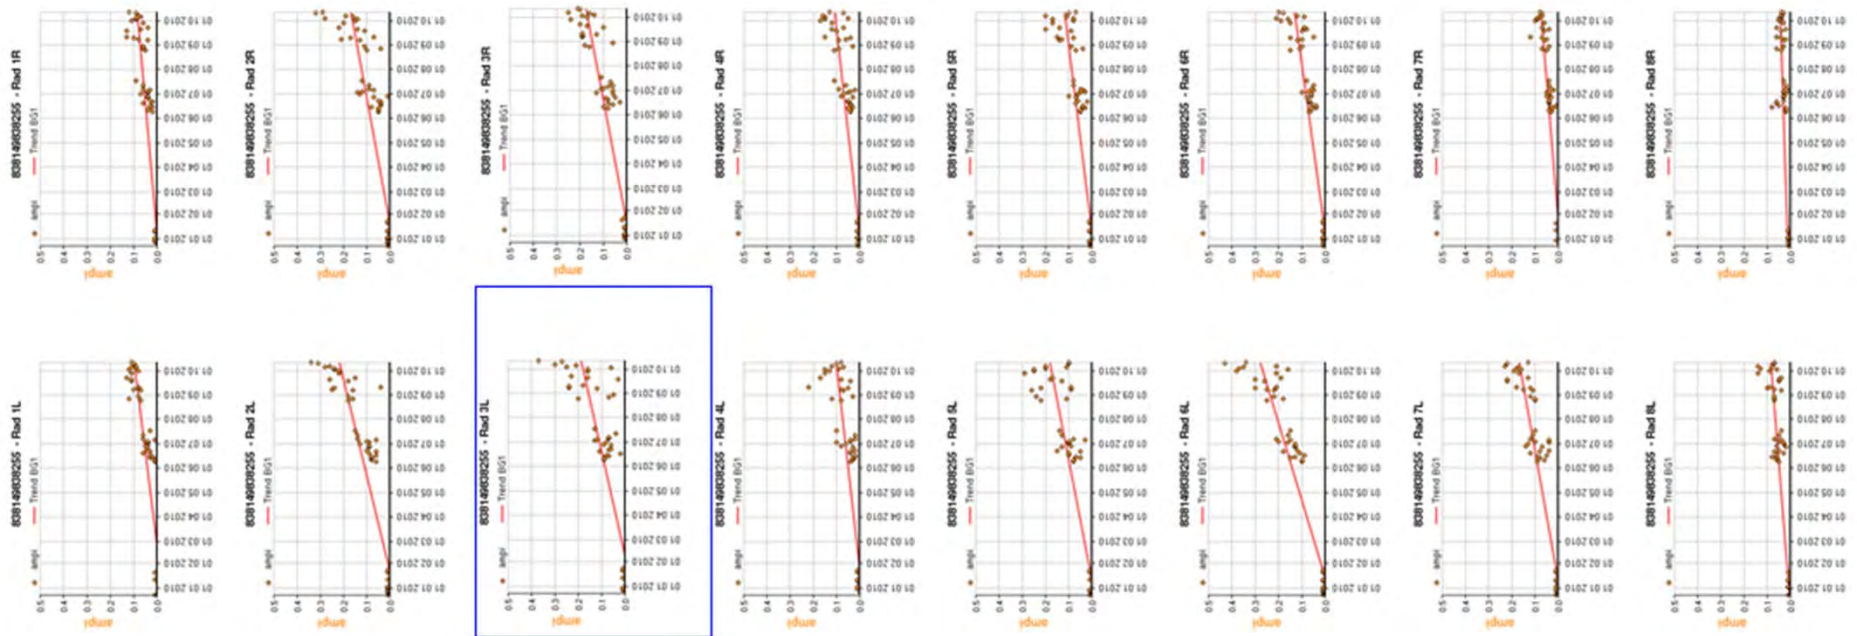

Argos[®] Measurement of wheel defects

Example development of wheel defects

amplitude (out-of roundness)
wheel defects Bogie 1

amplitude (out-of roundness)
wheel defects Bogie 2

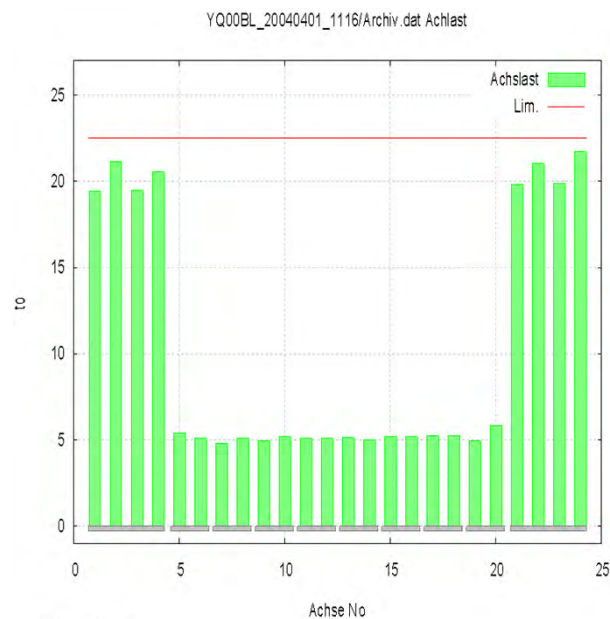

Argos[®] Level 3a - Y/Q derailment safety

- Continuous vertical Q forces in curves
- Continuous lateral Y forces in curves
- Accuracy better 2,5 % (Q/Y)
- Radius between 190m and 500m (installation on all track types possible, measuring length 12 meters)

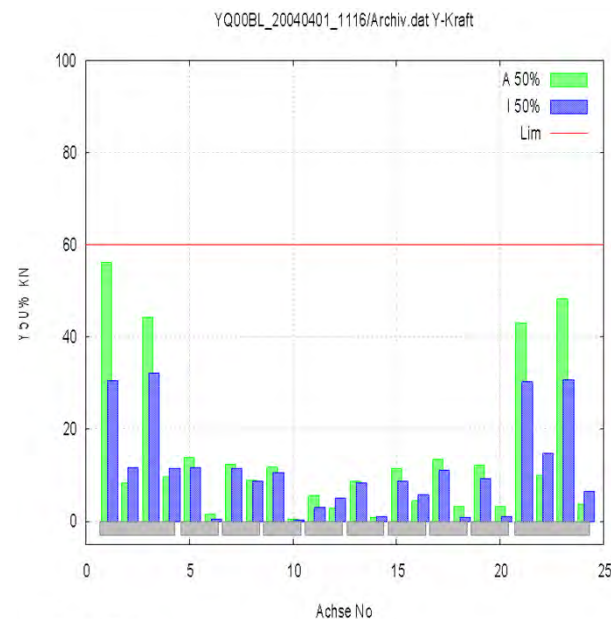

Argos[®] Level 3a – Results

Achslasten (Q-Kräfte)

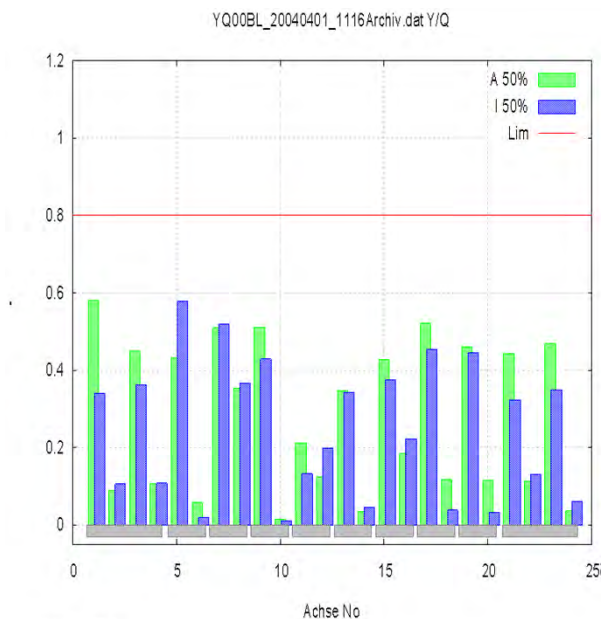

V1.01 (c) OEGB

Y-Kräfte

V1.01 (c) OEGB

Y/Q

V1.01 (c) OEGB

Argos[®] Level 3b – Instability and Noise

$\tan(\gamma) = 0.4$ mean value

Length = min 25 m

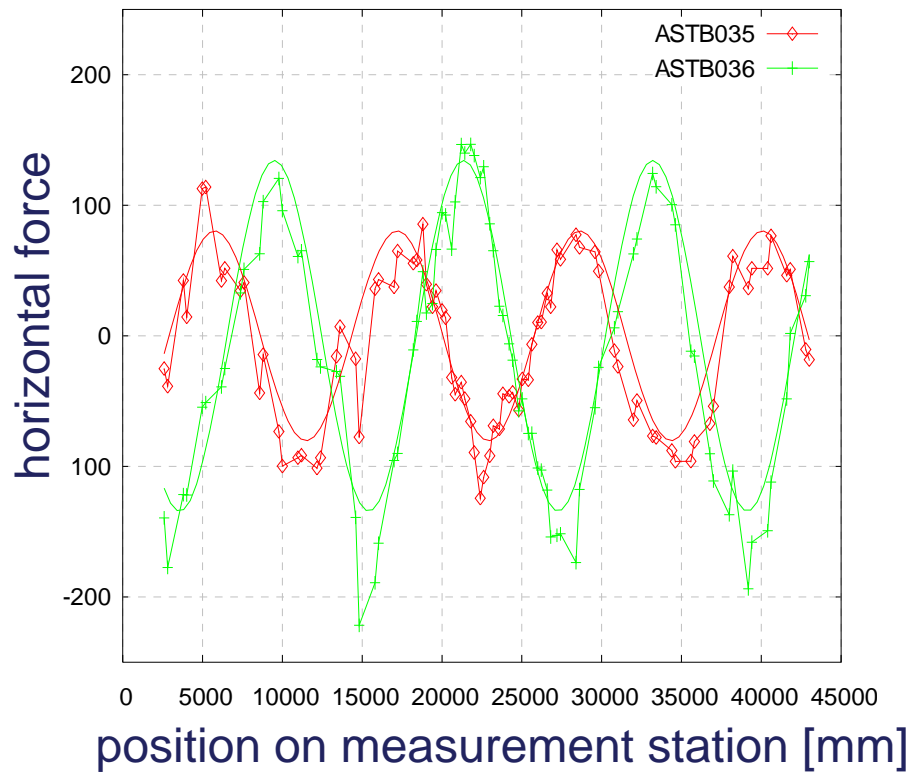

stable / instable 2-axle vehicle

stochastic

resonance

Source: FFG-Bericht/BAMM

Argos® Automatic data handling

Permanent TCP/IP connection

Data transfer via FTP

Data interfaces like xml, etc.

Limit exceeding reports, red-reports, Alarms

Signaling System

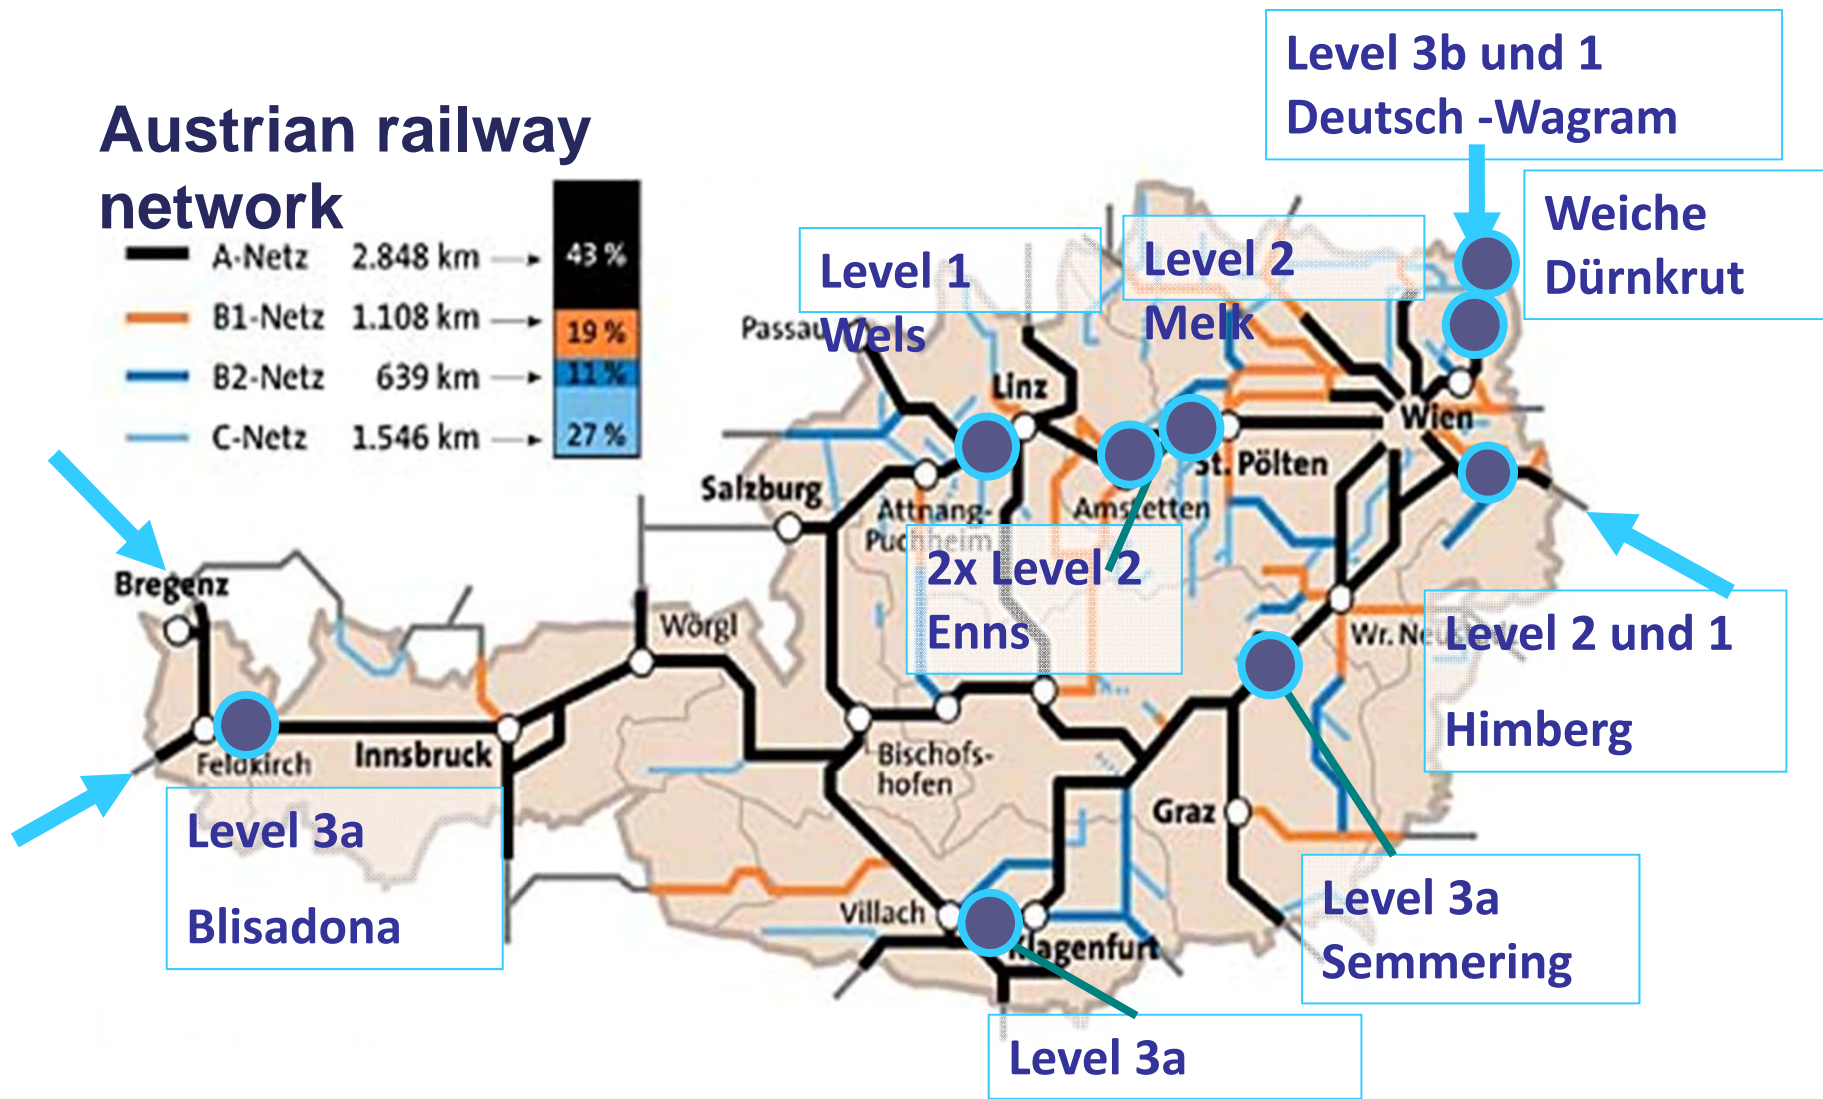

Result Handling:

User system: through web application

Expert system: through special applications (ARGOS-Client, ARGOS-Statistic), or data interfaces like xml, etc.

Argos® 10 systems installed in Austria

Austrian railway network

Argos[®] Cross Border Control System

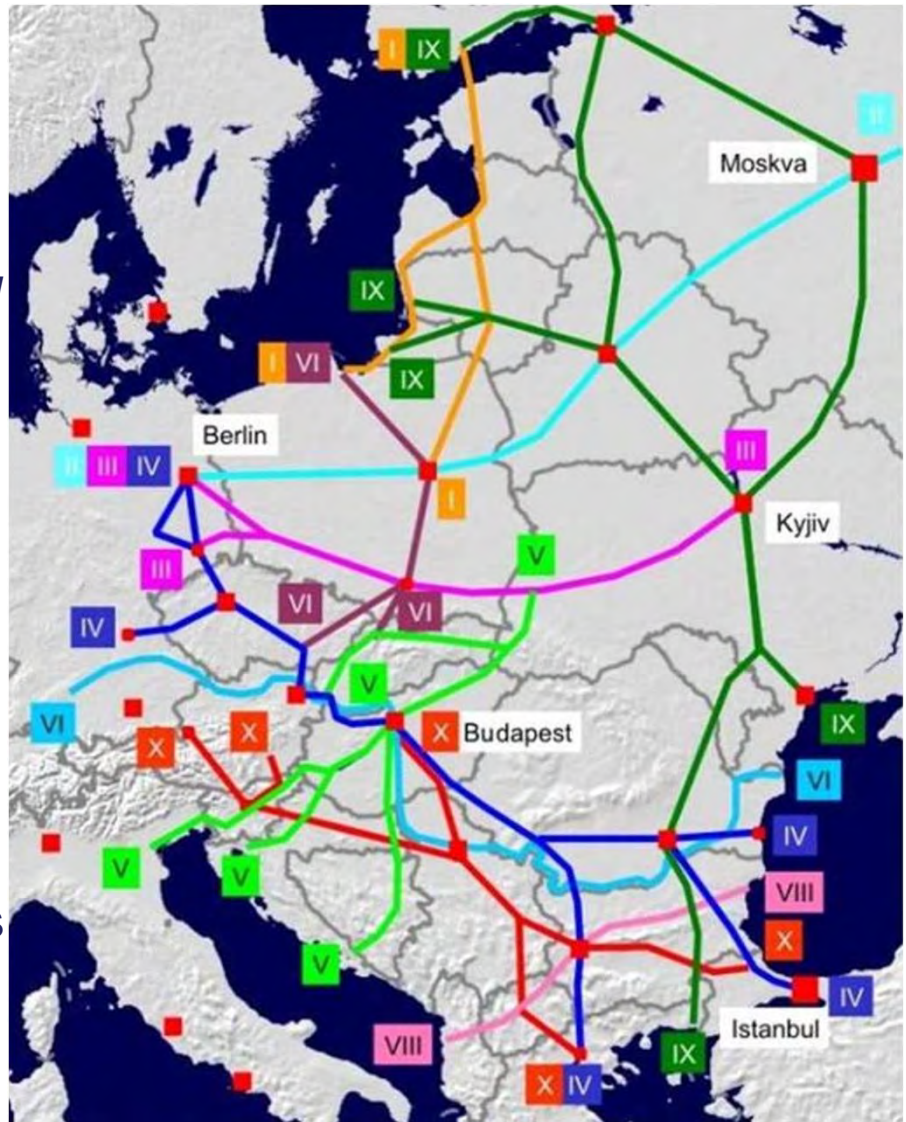

Reduce stopping times in border stations
e.g.: Korridor X line railways partnership

„We connect nations by establishing an cross-border infrastructure for freight and passenger traffic which is in line with market requirements and budget-conscious.“

Argos[®] gives objective measuring results about

- running safety
- weights and overloads
- wheel defects

No further inspections of these properties at the border stations are necessary.

Why use wayside train monitoring systems?

Quickly and objectively know how about vehicles and tracks interaction
reduce undesirable interaction situations

Enhanced Safety & Better Protection

and:

Correctly maintained and loaded vehicles reduce wear and Life cycle cost

Decreasing costs

- To reduce maintenance costs = Seamless infrastructure integration is necessary

Example 10.000km line (mixed strait line + curves):

Invest to install 40 Argos Systems ca. 20 Mio€

Costs saving (study Ernst Basler & Partner):

2-3 Mio€/year reduced maintenance costs

500 K€/year reduced costs after derailments

2-3 Mio€/year more income for correct freight pricing
