The GMI Coal Subcommittee focuses on supporting the identification and deployment of practical and cost-effective methane mitigation technologies and practices to reduce or eliminate emissions from coal mines. This is achieved by encouraging collaboration among Partner Countries, Subcommittee members, and Project Network members to build capacity, develop strategies and markets, and remove technical and non-technical barriers to methane mitigation project development. Ultimately, such collaboration can increase environmental quality, improve operational efficiency, and strengthen the economy via the additional methane brought to market.

**GMI Activities**

- **New design integrates more visual content**
- **Presents entry point for visitors who are less familiar with GMI**
- **Highlights features content and resources**

**Strategic Alliances**

- **UNECE**: The United Nations Economic Commission for Europe (UNECE) Group of Experts on Coal Mine Methane is a subsidiary body of the UNECE Committee on Sustainable Energy that works to promote mine safety and sustainability practices through activities focused on climate change mitigation and best practices to reduce CMM emissions and abandoned mine methane (AMM) drainage.
- **IEA**: The International Energy Agency (IEA), dedicated to ensuring reliable, affordable and clean energy for its member countries, provides a global dialogue on oil and gas, the coal market, renewable technologies, energy efficiency, and sustainability through publications, training and workshops.
Coal Sector Featured Resources

- Lets you scroll through featured content
- Can include documents, presentations, videos, or other web content
- Designed to be updated as new content is available
Global Methane Forum 2020

- 23 – 27 March 2020 in Geneva, Switzerland
- Co-hosted with UNECE
- GMI Meetings:
  - Coal Mines Subcommittee
  - Oil & Gas and Biogas Subcommittees
  - Steering Committee
  - Plenary Session
- UNECE Group of Experts on CMM
- Capstone event to celebrate the Global Methane Challenge

Recommendations for topics?
Send recommendations to ASG@Globalmethane.org.
Examples of Actions

- Quantify methane emissions from coal mines sector
- Maintain data for all large point sources
- Undertake assessment of the costs of abatement and publish results
- Share information on coal mines sector specific methane emissions
- Develop or promote implementation of best practices guidance documents for methane mitigation

Types of Mitigation Activities

- Ventilation Air Methane oxidation
- Degasification for pipelines injection
- Flow reversal allowing for excess heat to be transferred for heating use or power production
- Capture pre-mine drainage coal mine methane from underground coal mines for recovery and use
- Deploy oxidation technologies to mitigate ventilation air methane emissions
- Install gas collection systems to recover and use methane from closed “abandoned” underground coal mines
globalmethane.org/challenge

The Global Methane Challenge is your chance to tell the world what you are doing to reduce methane emissions. Whether you are ready to make a new commitment or want to highlight an ongoing effort, we want to showcase it here.

Why methane?
- Methane is a powerful greenhouse gas, and emissions are on the rise.
- Methane is a short-lived climate pollutant, so reductions made now can have significant short term benefits.
- Cost-effective technologies to capture and use methane are widely available today.

It's time to take action! Join the Global Methane Challenge and showcase your work to reduce methane emissions.

The Global Methane Challenge is open to all public and private sector actors interested in showcasing their actions to reduce methane emissions. The goal of the challenge is to catalyze ambitious action to reduce methane emissions and showcase policies and technologies being used to reduce methane emissions around the world.

**China**

China has been the world's largest coal producer for the past three decades and is the world's leading contributor of coal mine methane (CMM) emissions, expected to become roughly 61% of the global total in 2020. In 2017, demand for coal in China reached 2,752 million tonnes of carbon equivalent (Mtce) and its mines captured 12.8 billion cubic meters (bcm) of CMM. China's ambitious goals include lowering its carbon intensity of GDP by 60%-65% below 2005 levels by 2030. Increased recovery and use of CMM will help China achieve these targets, and will also improve mine safety.

To help lead these efforts, the International Centre of Excellence on Coal Mine Methane (ICE-CMM) in China was launched in September 2017. Located in Taiyuan City, Shanxi Province and hosted by one of China's largest coal producers, Shanxi Coking Coal Group Ltd (SCCG), the Centre is situated in one of China's principal coal mining regions. Launching the ICE-CMM is an important step in China's transition to a more sustainable energy future.

The main function of the Centre is to serve as a regional and international center for best practices in gas capture and utilization. Its objectives include increasing clean power generation, reducing greenhouse gas emissions, and improving mine safety. In addition, the ICE serves as a forum for communication and exchange among Chinese and international experts.
