

The new global dynamics for coal

Benjamin Sporton
Chief Executive

As electricity changes, coal retains an edge

Global electricity mix

1.2 billion people live without access to electricity

People without access to modern energy services by region

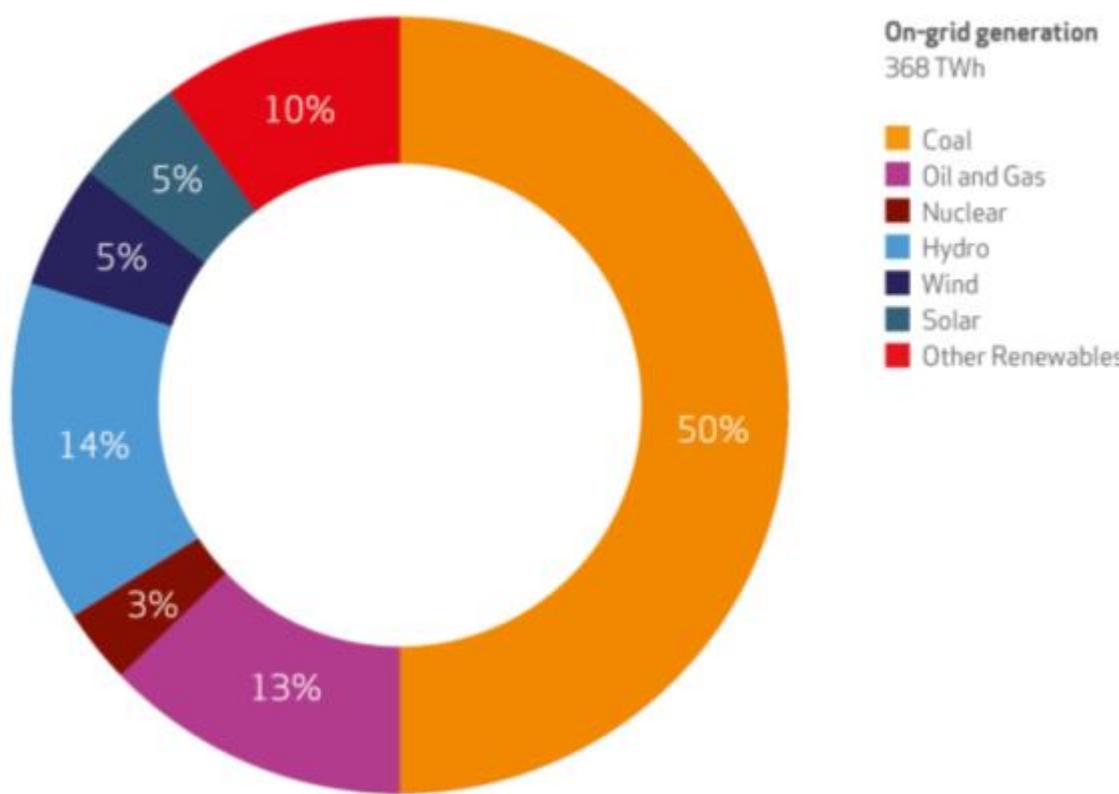

- 1.2 billion people worldwide live without access to electricity
- 2.7 billion rely on traditional fuels for cooking

Source: International Energy Agency, World Energy Outlook 2016

Coal is key in addressing global energy poverty

Additional on-grid electricity generation by fuel in the “Energy for All Case” compared with the New Policies Scenario, 2030

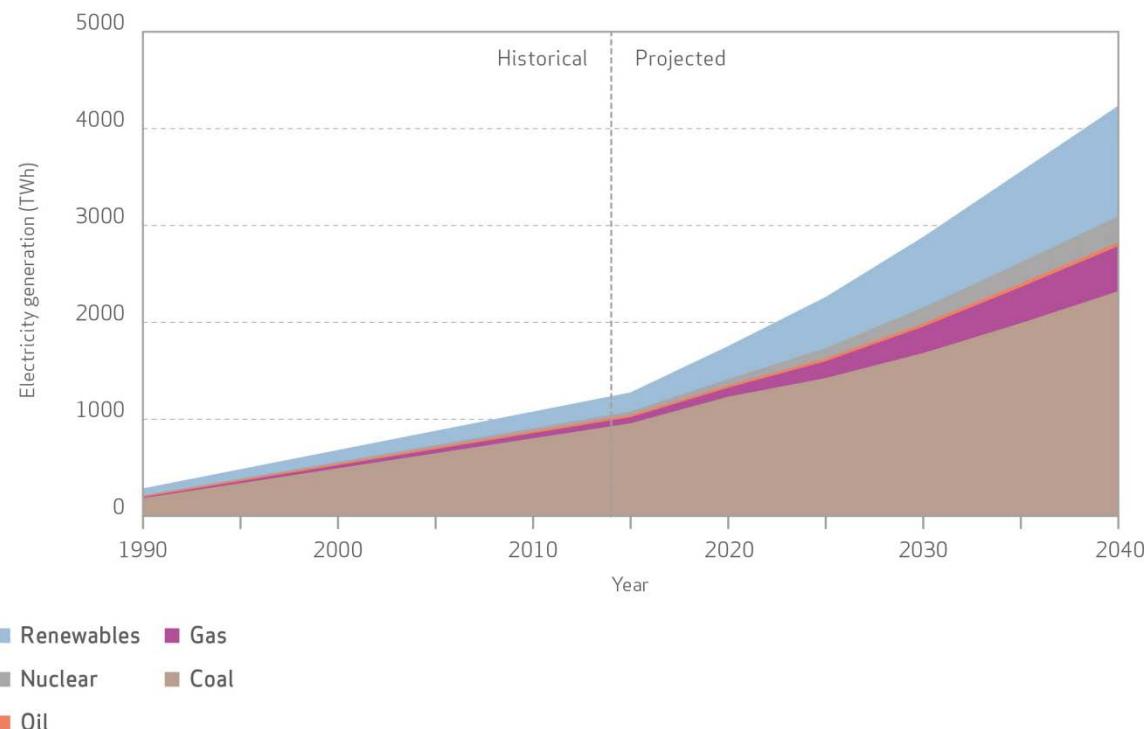

Source: World Energy Outlook, 2011

Coal will drive India's economic growth...

- Electricity demand in India is expected to average 4.4% pa over the next 25 years
- Coal generation capacity more than doubles, while renewables also increase significantly to meet demand
- IEA indicates that maintaining an adequate electricity supply represents a significant investment challenge requiring \$2 trillion (in 2013 dollars)

India's electricity generation by source in the New Policies Scenario

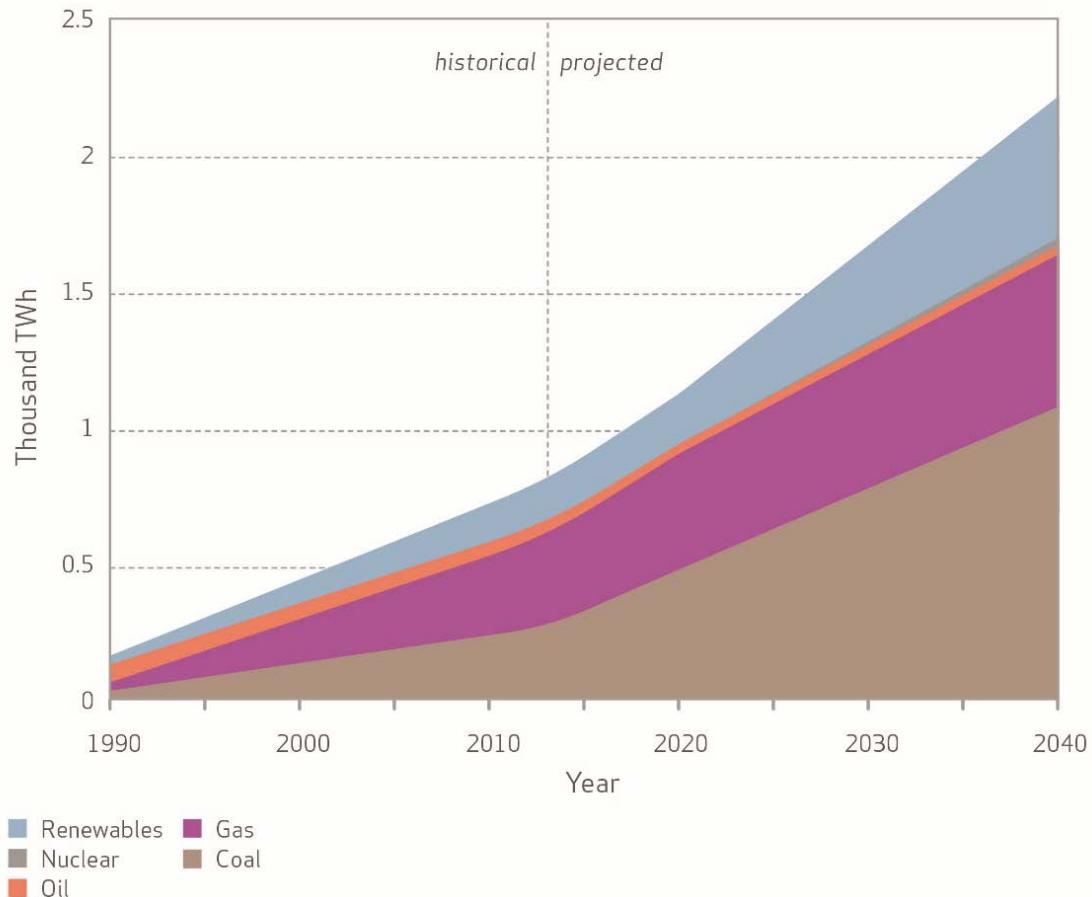

Source: International Energy Agency, World Energy Outlook 2016

... and will be critical in powering up SE Asia

- The share of coal in power generation rises from 32% to 50%
- Renewables-based electricity generation increases three and half times from today to 2040 (481 TWh)
- IEA highlights \$2.4 trillion investment is required over the period to 2040. This represents around 5% of the global total, or one-third of China's investment

Southeast Asia electricity generation by source in the New Policies Scenario

Coal will be critical to China for decades

- China's electricity demand growth will be around 4.8% to 2020, then decline to around 2% through to 2040
- Electricity generation from coal will be 4.3% higher in 2040, despite its share of generation reducing from 73% to 43%
- Non-hydro renewables are expected to increase 1200% over the same period (25% of world generation)

The Paris Agreement includes low emissions coal

New technology dramatically reduces CO₂

Efficiency improvements can significantly contribute to CO₂ emission reductions

- The most important near-term action to reduce CO₂ emissions is to increase the efficiency of coal-fired power plants
- 1% increase LHV efficiency = 2–3% points decrease in CO₂ emissions

Source: VGB PowerTech 2013

Cleaner coal is real but needs more action

- Japan and China have been the most active in building USC plants
- J-Power upgraded their 1967 sub-critical Isogo 38% efficient coal-fired power plant to an USC 43% efficiency plant with SOx, NOx, PM reduced to less than 1/3 of previous levels
- China's Waigaoqiao plant has a capacity of 5,000MW and China is relying on these larger, advanced units for dispatch to displace higher emission from older, less efficient power stations
- The units have integrated advanced air quality control systems, yielding non-carbon air emissions well below China's latest more stringent standards, and also below comparable standards in North America and Europe

WCA proposes the PACE concept to support HELE

A Global Platform for Accelerating Coal Efficiency

- International platform to help drive deployment of HELE technologies in developing and emerging economies
- Public private partnership
- Currently seeking partners to help build an initial alliance

The potential impact of HELE is significant in a global context

Emission reductions by policies / actions, bn tonnes CO₂ equivalent

Policy / Action	Cumulative emissions	Period	Annual emissions*
Montreal protocol	135.0bn	1989-2013	5.6bn
Hydropower worldwide	2.8bn	2010	2.8bn
Nuclear power worldwide	2.2bn	2010	2.2bn
Increase average global efficiency of coal-fired power plants to 40%			2bn
China one-child policy	1.3bn	2005	1.3bn
Other renewables worldwide	600m	2010	600m
US vehicle emissions & fuel economy standards [†]	6.0bn	2012-2025	460m
Brazil forest preservation	3.2bn	2005-2013	400m
India land-use change	177m	2007	177m
Clean Development Mechanism	1.5bn	2004-2014	150m
Collapse of USSR	709m	1992-1998	118m
Global Environment Facility	2.3bn	1991-2014	100m
EU energy efficiency	230m	2008-2012	58m
EU renewables	117m	2008-2012	29m

* Annual emissions are cumulative emissions divided by the relevant period.

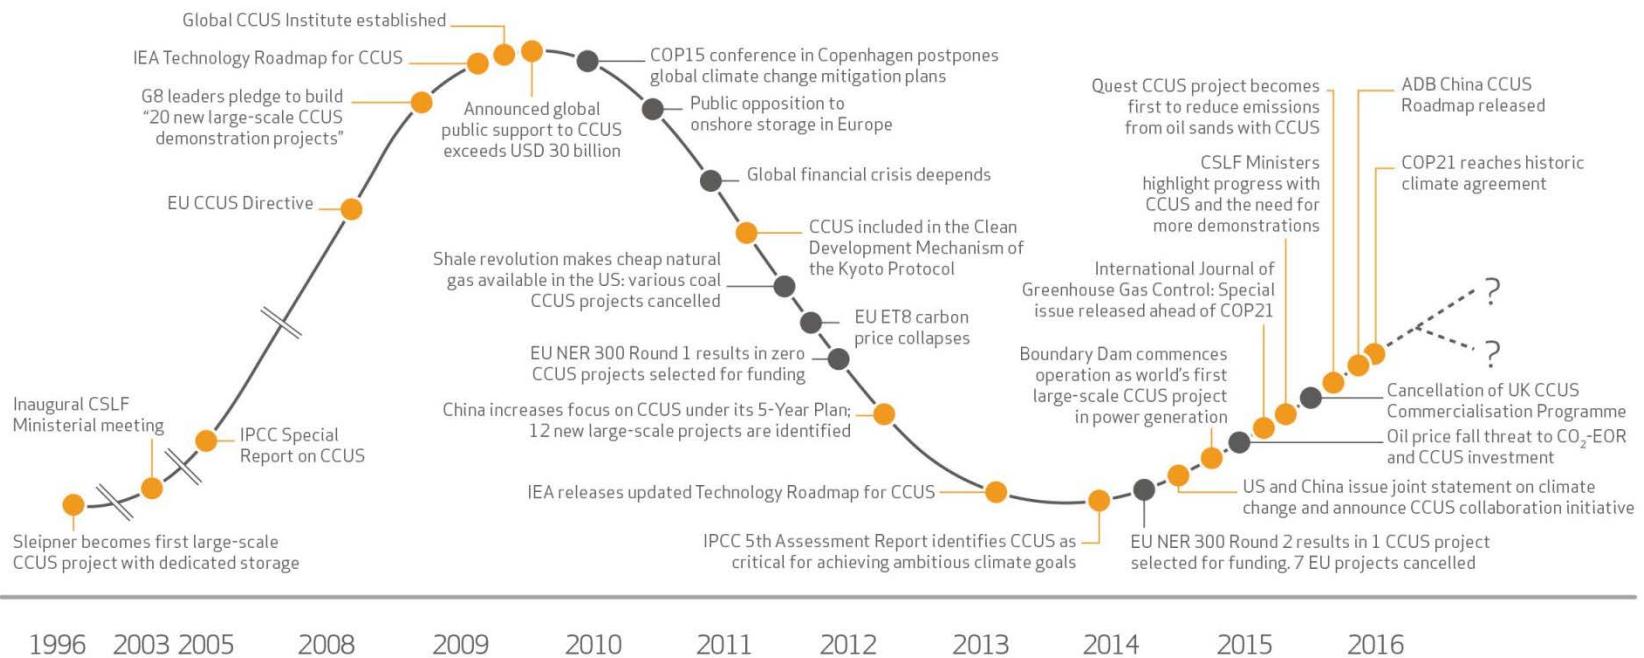

The estimate for the current emissions avoided under the Montreal protocol is eight billion tonnes of CO₂e.

The annual figure for the collapse of the USSR refers to the years 1992-1998.[†]Cars and light trucks

There are real challenges to high renewable penetration

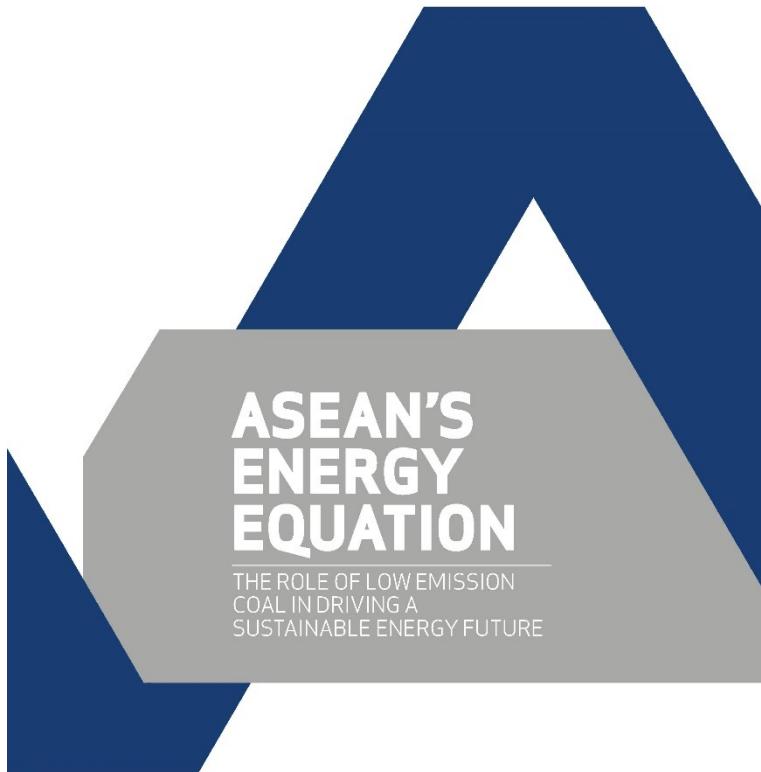

Power Generation and Demand, Germany December 2016

Agora Energiewende, December 18, 2016

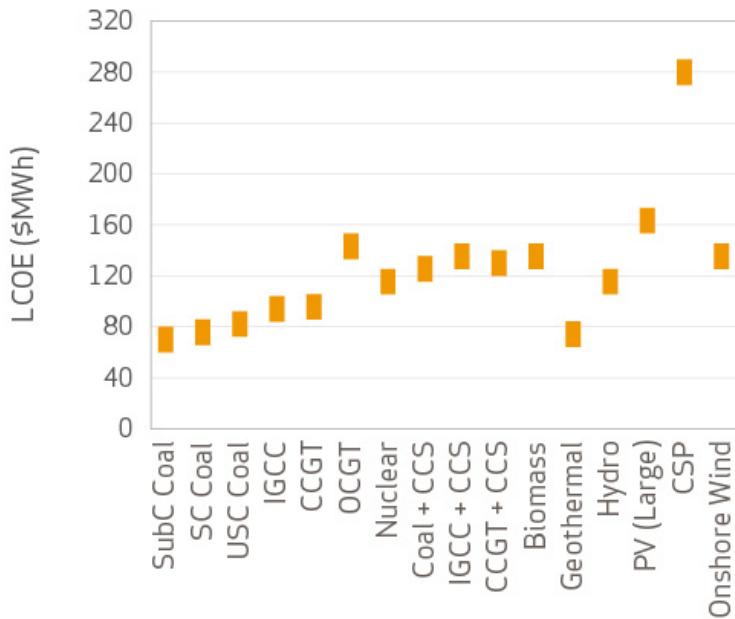

ASEAN's Energy Equation

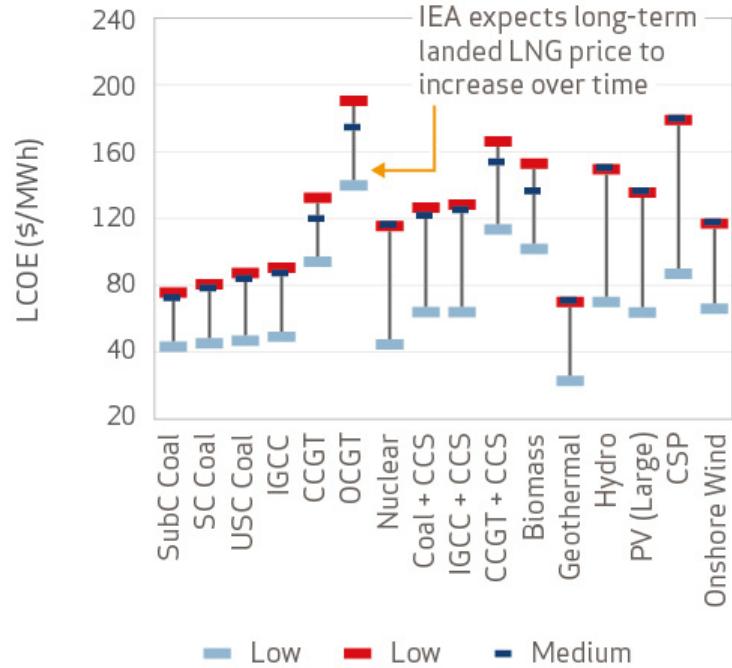

- 'Coal and Cleaner Coal Technologies' (CCT) were identified as a key programme area in APAEC 2016 – 2025
- '**ASEAN Energy Equation**' provides a comprehensive analysis of the energy security and sustainable development opportunities that CCT provide

Cleaner coal is the lowest cost option among the low-carbon technologies

ASEAN Average
2020 Commercial Operation

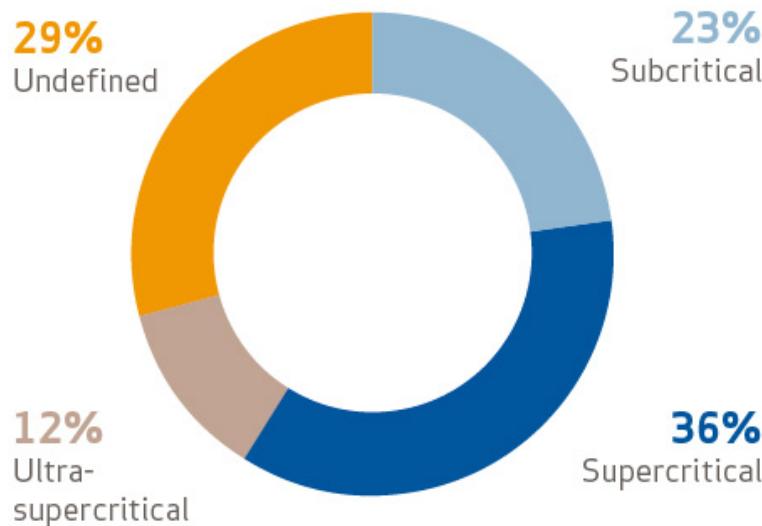

ASEAN Average
2035 (No CO₂ Price Assumed)

Improving coal efficiency delivers cost benefits locally and emissions reductions globally

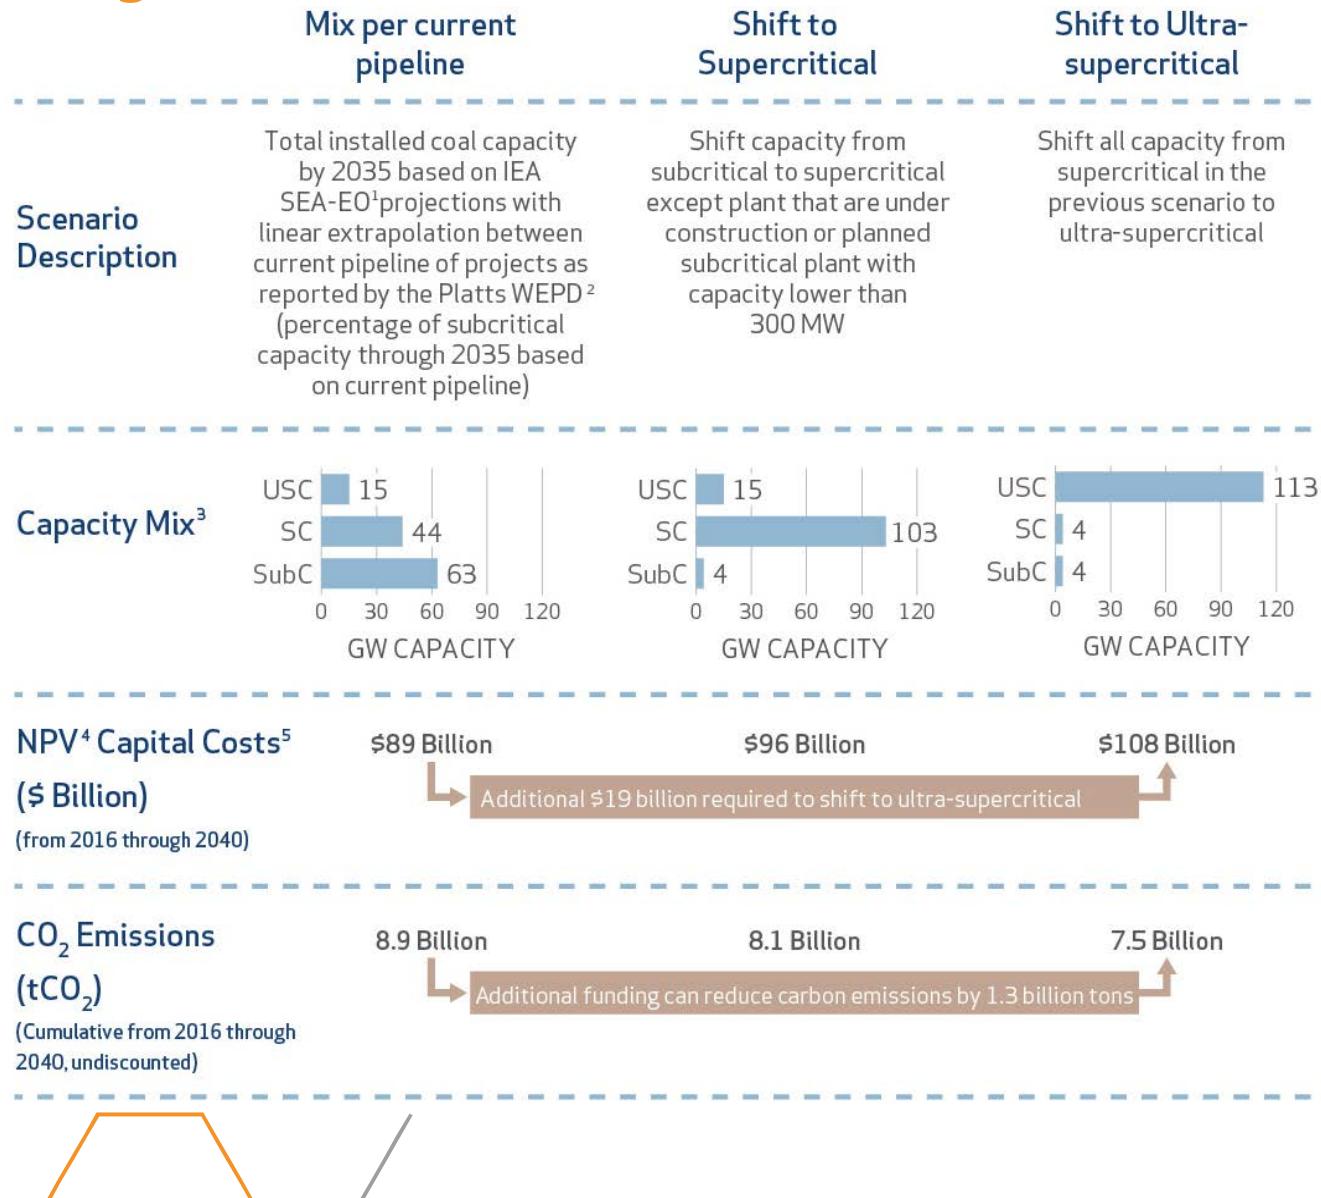

ASEAN

Under Construction and Planned Coal Fired Capacity (80GW)

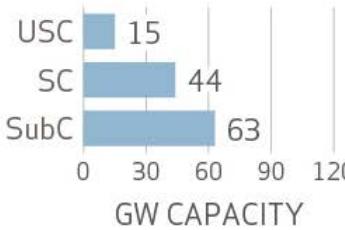

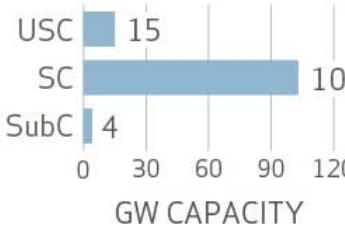

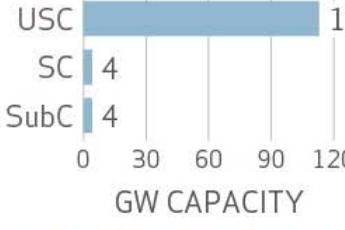

- Promoting HELE deployment across ASEAN would result in significant carbon emissions reduction to global benefit.
- Shifting the region's forecast coal capacity in 2035 from the current mix to ultra-supercritical would reduce cumulative emissions by 1.3 billion tonnes.
- This is an equivalent reduction of –
 - The yearly emissions from China, United States and the EU (top three CO₂ contributors), or
 - Three years of international shipping, or
 - More than four years of international aviation

Mobilising finance will be an important factor in realising this outcome...

...The benefits are significant

Scenario	Capacity mix ¹	CO ₂ emissions (tCO ₂) (over 40 years)	CO ₂ abated equivalent to		
			Subcritical plant closure ²	Number of new wind turbines ³	Cars removed from the road ⁴
Mix per development pipeline	 USC 15 SC 44 SubC 63 GW CAPACITY	22.8 Billion			
Shift to Supercritical	 USC 15 SC 103 SubC 4 GW CAPACITY	20.8 Billion	 20	 15,000	 96 million
Shift to Ultra-Supercritical	 USC 113 SC 4 SubC 4 GW CAPACITY	19.5 Billion	 32	 25,000	 157 million

Investment to ensure an efficient coal fleet in Southeast Asia is vital for global climate ambitions

Assuming a \$1 Billion Investment

Enhanced investment in coal to improve efficiency is arguably one the most effective mitigation actions available

WCA encourages ASEAN Member States to adopt 'ASEAN's Energy Equation's Call to Action'

1. Statement emphasising continued commitment to the deployment of cleaner coal technologies
2. With necessary support from partners, member states commit to enhanced action, ultimately leading to a pledge to end the use of subcritical coal (where feasible)
3. Calling on the international community to provide support for cleaner coal technology deployment
