ABSTRACT

In Slovenia, Statistics on Income and Living Conditions (SILC) is the source for calculating relative poverty and social exclusion indicators. The concept of relative poverty does not tell us enough about the actual living standard of Slovenian households, as many of them possess their own house, dwelling, land or other real estate. According to the 2015 Register-based Census data, 90% of the Slovenian population lives in their own dwellings. In order to examine the correlation between the value of real estate owned by the Slovenian households and the income class they belong to, we will link microdata from the SILC survey with data on the real estate owners from the Real Estate Register.
