ECONOMIC COMMISSION FOR EUROPE

INLAND TRANSPORT COMMITTEE

World Forum for Harmonization of Vehicle Regulations (WP.29)

Working Party on Lighting and Light-Signalling (GRE)
(Fifty-first session, 15-19 September 2003,
agenda item 1.3.1.)

PROPOSAL FOR DRAFT AMENDMENTS TO REGULATION No. 98

(Headlamps with gas-discharge light sources)

Transmitted by the secretariat

Note: The text reproduced below was prepared by the secretariat (see TRANS/WP.29/GRE/50, para. 43). It based on the consolidated text of TRANS/WP.29/GRE/2002/41 (by GTB), TRANS/WP.29/GRE/2003/16 (by Italy), as amended in para. 42 of the GRE report TRANS/WP.29/GRE/50, and the document without a symbol (informal document No. 17 by Germany), distributed during the fiftieth GRE session.

Note: This document is distributed to the Experts on Lighting and Light-Signalling only.
A. PROPOSAL

Table of contents, annexes, amend to read:

"...
Annex 9 - Minimum requirements for sampling by an inspector
Annex 10 - Definition and sharpness of the "cut-off" line for headlamps"

The text of the Regulation,

Paragraphs 6.2.1 to 6.2.2., amend to read:

"6.2.1. The passing beam shall produce a sufficiently sharp "cut-off" as defined in annex 10 to this Regulation, to permit a satisfactory adjustment with its aid.

6.2.2. The headlamp shall be visually aimed by means of the "cut-off" line which is specified in annex 10 of this Regulation, so that:"

Paragraph 6.2.2.1., amend to read (including the deletion of the reference to footnote 9/ and footnote 9/):

"6.2.2.1. in the case of headlamps designed to meet the requirements of right-hand traffic, the "cut-off" on the left-half of the screen is horizontal and, in the case of headlamps designed to meet the requirements of left-hand traffic, the "cut-off" on the right-half of the screen is horizontal.

The test screen for visual adjustment shall be positioned at

- either a distance of 10 m and this horizontal part of the "cut-off" is situated on the screen 10 cm below the level hh (see annex 3); or at distance of 25 m and this horizontal part of the "cut-off" is situated on the screen 25 cm below the level hh (see annex 3);

- and be sufficiently wide to allow examination and adjustment of the "cut-off" over of at least 5° on either side of the v-v-line."

Paragraph 6.2.2.2., amend to read:

"6.2.2.2. for horizontal adjustment: The kink or elbow of the "cut-off" line shall be situated at the v-v-line, as described in annex 10. If the beam does not have a clear elbow, the lateral adjustment shall be effected in the manner which best satisfies the requirements for illumination at points 75R and 50R for passing beams for right hand side traffic and for points 75L and 50L for left hand side traffic."
Insert new paragraphs 6.2.2.3. and 6.2.2.4., to read:

"6.2.2.3. for vertical adjustment: The horizontal part of the "cut-off" line is moved from downward upwards and adjusted to its nominal position 1 per cent below the h-h-line, as described in annex 10, which is:

- 10 cm below the headlamp axis on the screen at 10 m distance or which is
- 25 cm below the headlamp axis on the screen at 25 m distance.

6.2.2.4. If, however, vertical adjustment cannot be performed repeatedly to the required position within the allowed tolerances, the instrumental method of annex 10, paragraphs 4. and 5. shall be applied to test compliance with the required minimum quality of the "cut-off" line and to perform the beam vertical adjustment."

Paragraph 6.2.4., delete the reference to footnote 10/ and footnote 10/.

Paragraph 7., the reference to footnote 11/ and the footnote 11/ (former), renumber as footnote 9/.

Annex 1,

Insert a new item 9.6., to read:

"9.6. The determination of cut-off gradient was carried out at 10m / 25m 2/ ."

Item 9.6. (former), renumber as item 9.7.

Annex 8,

Insert a new paragraph 1.5., to read:

"1.5. If, however, vertical adjustment cannot be performed repeatedly to the required position within the allowed tolerances, the quality of cut-off according to the procedure described in annex 10, paragraphs 2. and 3., shall be tested on one of the sampled headlamps."

Annex 9,

Insert a new paragraph 1.5., to read:

"1.5. If, however, vertical adjustment cannot be performed repeatedly to the required position within the allowed tolerances, the quality of cut-off according to the procedure described in annex 10, paragraphs 2. and 3., shall be tested on one of the sampled headlamps."
"Annex 10

DEFINITION AND SHARPNESS OF THE "CUT-OFF" LINE FOR HEAD LAMPS

1. General:

The luminous intensity distribution of the headlamp shall incorporate a "cut-off" line which enables the headlamp to be adjusted correctly for the photometric measurements and for the aiming on the vehicle.

The "cut-off" line shall consist of

i) a straight "horizontal part" towards the left,
ii) a "shoulder line part" towards the right,
iii) one clear "kink", in between and formed by the "cut-off" parts defined above.

The characteristics of the "cut-off" line shall comply with the requirements set out in paragraphs 2. to 4. below:

2. Shape of the cut-off line:

For visual adjustment of the passing beam the cut-off line shall provide a horizontal line for vertical adjustment of the headlamp between 0.5° and 4.5° distant from the v-v-line (see Figure 1), which does not exceed a vertical extend of $\Delta \beta = 0.2$ degree up or down.

Figure 1:
3. Visual adjustment of the passing beam:

3.1. Horizontal adjustment:

The beam with its the "cut-off" line shall be moved from right to left (left hand traffic: from left to right) until the "kink" or "elbow" is situated at the v-v-line. If the "elbow" forms no sharp enough edge, that point shall be taken, where the horizontal line through the straight part and the steepest tangential line onto the shoulder part of the cut-off line are crossing (for examples see Figure 2). The "shoulder line part":

(a) does not extend the tangential line "B" going from the "kink" upwards to the right and being inclined versus h-h by 60°;

(b) does not extend the tangential line "A" going from the "kink" upwards to the right and being inclined versus h-h by 10°;

(c) has a vertical extension of at least $\Delta \beta = 0.57^\circ$ over a distance of 2° to the left (right hand traffic) and 2° to the right (left hand traffic).

Figure 2:

![Diagram](image)

circle to indicate the "kink point", defined according to the provisions of paragraph 1.3. of this annex.

3.2. Vertical adjustment:

After horizontal adjustment of the passing beam according to paragraph 3.1. above, the vertical adjustment of the passing beam shall be performed in such a way that the beam with its cut-off line is moved from downwards upwards until the horizontal part of the cut-off line is situated at nominal vertical position. If the horizontal part is not straight but slightly curved or inclined, the cut-off line between the distant, as described in paragraph 2. above, shall not exceed the range between two horizontal lines situated at 0.1° above and below the nominal position (see Figure 2 above). The vertical adjustment shall be performed in the point 2.5° left (for beams for left hand side traffic: 2.5° right).

3.2.1. If the horizontal part of the cut-off line does not provide sufficient quality for visual adjustment or if the visual adjustments of three trained individuals differ by more
than 0.2°, the quality of cut-off shall be tested instrumentally for compliance with requirements as follows.

4. **Measurement of the quality of cut-off:**

Measurements shall be performed by vertically scanning through the horizontal part of the cut-off line in angular steps not exceeding 0.05° at either a measurement distance of:

- 10 m and a detector with a diameter of approximately 10 mm or at a measurement distance of
- 25 m and a detector with a diameter of approximately 30 mm.

The measurement of the cut-off quality shall be considered acceptable if the requirements of paragraph 3.1.2. of this annex shall comply with at least one measurement at 10 m or 25 m.

The measuring distance at which the test was determined shall be noted down in paragraph 9. of the communication form (see annex 1 of this Regulation).

After visual horizontal adjustment according to paragraph 2.2. above, the scanning is done from downwards upwards through the cut-off line along the vertical lines at 1.5°, 2.5° and 3.5° left (for left hand side traffic: right) of the v-v-line). If so measured, the quality of the cut-off shall meet the following requirements:

4.1. **Not more than one cut-off line shall be visible** 1/.

4.2. **Sharpness of cut-off:**

If scanned vertically through the horizontal part of the cut-off line at 2.5° distant from the v-v-line, the maximum value measured for

\[ G = (\log E_\beta - \log E(\beta + 0.1°)) \]

is called the sharpness factor G of the cut-off line. The value of G shall not be less than 0.13.

4.3. **Linearity:**

The part of the cut-off line which serves vertical adjustment shall be horizontal between 0.5° and 4.5° distant from the v-v-line. This requirement is deemed to be met when the vertical position of the inflection points (where \( d^2 (\log E ) / d\beta^2 = 0 \)) at 1.5°, 2.5° and 3.5° horizontal distance from the v-v-line are located within a band width of +0.2° from the nominal vertical position of the cut-off line at 2.5° sideward of the v-v-line, see Figure 3.

1/ This paragraph will be amended, if an objective test method is available.
Figure 3:

5. **Instrumental vertical adjustment:**

If the cut-off line complies with the above quality requirements, the vertical beam adjustment can be performed instrumentally. For this purpose, the inflection point at 2.5° distant from the v-v-line where \( \frac{d^2 (\log E)}{dv^2} = 0 \) is positioned at the nominal position below the h-h-line. The movement for measuring and adjusting the cut-off line shall be upwards from below the nominal position.
