Amendment to Regulation No. 117, Concerning Manufacturer’s Information about Tyre Rolling Resistance Coefficients.

RF experts - 15/02/2009
The WP.29 146-th session resolution concerning the amendment to the Regulation #117 reads:

"33. The GRRF Chairman, Mr. Yarnold (United Kingdom), informed WP.29 about the results achieved by GRRF during its sixty-fourth session (for more details, see the report of the session ECE/TRANS/WP.29/GRRF/64). 34. He reported that GRRF had considered in detail the possible insertion of the provisions for rolling resistance either into Regulations Nos. 30 and 54, or into Regulation No. 117. As rolling resistance is mainly an environmental issue linked to fuel efficiency, GRRF had finally agreed to insert these provisions into Regulation No. 117 and that GRB should resume consideration of this subject at its next session in February 2009 on the basis of a revised proposal. WP.29 endorsed that decision by GRRF."
Document under consideration is of world-wide socio-ecological importance because tyre heat dissipation and emissions are out of the control in world scale at present time.
The warm effects of rolling tyres and industry are comparable

Heat dissipation into environment (yearly average)

- Power stations
  - Thermal
  - Hidro
  - Nuclear

Energy

- Production
- Heating
- Lighting
- Transportation

Heat dissipation into environment

- 1.76 billion kW (2004)
- 1.60 billion kW

3
Calculation of energy dissipation:

The annual world motor gasoline consumption reported by US Energy Information Administration (2003):
\[ V = 20410,8 \cdot 10^3 \text{ barrels per day} \approx 924 \text{ millions tons/year} \]
Low calorific value: \( H = 44000 \text{ kJ/kg} \)

The average generated power of the gasoline vehicle fleet:

\[
N = \frac{924 \cdot 10^9 \text{ kg} \cdot 44 \cdot 10^6 \text{ J/kg}}{365 \cdot 24 \cdot 3600 \text{s}} \approx 1.3 \cdot 10^9 \text{ kW}
\]

And taking into account the diesel fuel (expert evaluation coef. 1.55):

\[
N = 1.3 \cdot 1.55 \cdot 10^9 \text{ kW} = 2.02 \cdot 10^9 \text{ kW}
\]

RR heat dissipation (50% of \( N \)):

\[
N_{RR} = 1.66 \cdot 10^9 \text{ kW}
\]

(RF experts)– 15/02/2009
The heat generated by rolling tyres is comparable with all the heat produced by the industry.

(Data in billions of kW)

The main uniqueness of the situation in this field is unbalanced requirements for energy parameters of automotive tyres and engines.

(RF experts) – 15/02/2009
World vehicle fleet presented as a 5-row pack would be 1.1 mln. km long (3 times the distance from the Earth to the Moon).
At present the planet has:

- 6.4 billion inhabitants
- 3.9 billion tyres in use

Tyres per inhabitant:

- 4.0 in USA
- 3.0 in France
- 3.0 in Germany
- 3.0 in Italy
- 3.0 in Japan
- 0.6 in the World

(RF experts) – 15/02/2009
3.9 billions of tyres used in the World can make a 2.67 million km long chain.

It would be 7 times longer than the distance between the Earth and the Moon or 66 times longer than the length of the equator

(RF experts) – 15/02/2009
Tire rolling resistance is a highly unusual object of GRRF examination. Being equal to the productive industry in power consumption it generates only negative effects.

Annually per each inhabitant of developed countries it results in up to:

- 1.5 kW – heat dissipation
- 750 kg – pollutants
- 6 kg – tyre dust
- 1000 kg – carbon dioxide (CO₂)

Standardization of the tyre rolling resistance is urgent. The manufacturers’ rolling resistance declarations are the first step.

(RF experts)– 15/02/2009
AMENDMENT TO REGULATION No. 117 REGARDING MANUFACTURER’S INFORMATION ON ROLLING RESISTANCE COEFFICIENT

3. APPLICATION FOR APPROVAL
3.1. The application for approval of a type of tyre with regard to this Regulation shall be submitted by the tyre manufacturer or by his duly accredited representative. It shall specify:

........................................

New paragraph:

"3.1.11 A value of rolling resistance coefficient determined according to ISO 28580 for the tyre of representative size with a list of designated range of tyre sizes and tread patterns covered by representative data."

Paragraph 3.1.11 takes into account that in general case the designated range of tyre sizes may differ from that in paragraph 3.1.10, connected with tyre noise level and wet grip adhesion parameters.

Changes are made in paragraph 5.1 in accordance to p.3.1.11, new paragraphs 12.4 and 15.3 are added (see document inf GRB-49-02).
This Amendment to Regulation No.117 concerns the information strategy in the field of tire quality improvement. The end-user information process is de jure independent from standardization although both are naturally connected.

The UNITED NATIONS GUIDELINES FOR CONSUMER PROTECTION (09/29/2001,UNCTAD/DITC/CLP/Misc.21) declare that one the legitimate needs which the guidelines are intended to meet is “access of consumers to adequate information to enable them to make informed choices according to individual wishes and needs”.

Although the Information Strategy for tyre industry is rather soft it is more effective then Regulatory Strategy because first of them gives a competitive stimulus to improve tyre quality.

The end-user information strategy presented in the proposed Amendment may be put in action as soon as ISO 28580 is adopted, i.e. this year. It will be used during the period before EC RR norms adoption and then in parallel with them.

(RF experts)– 15/02/2009
Methods of tyre rolling resistance measurement are a subject of ISO 18164 and now ISO 28580 (referenced in the proposed amendment)

\[
M = \frac{1}{R} \frac{dV}{dt}
\]

where S – distance, t and \( \tau \) – time. So in general case the deceleration error is:

\[
\delta_j = \sqrt{\sum_{i=1}^{\delta S} \left( \frac{\delta_j}{\delta x_i} \right)^2 \left( \delta x_i \right)^2}
\]

where \( x_i \equiv S_1, S_2, \tau_1 \ldots \tau_4, t_1, t_2 \);
\( \delta x_i \) – an error of each parameter.

A new version of the deceleration method is developed and is being added to ISO 18164 as an amendment.

(RF experts) – 15/02/2009 12
History of the Rolling Resistance Problem

ISO 28580 (RR determination methods)

2.0 million tons of fuel is burnt every day to counteract tyre RR.

Norms adoption?

Prognosis (6 years)

History (9 years)
An example of high social and ecological responsibility of a leading tyre manufacturer

In 15 years, compared to conventional tires on the road, the 570 million Michelin “green” energy saving tires sold worldwide have reduced fuel consumption by an estimated 2.38 billion gallons, resulting in a reduction of CO2 emissions of 25 million tons, the equivalent of the amount absorbed by 880 million trees in one year. This means that each second 11.6 gallons of fuel are saved and 240.6 pounds of CO2 are not released into the atmosphere.

Michelin is the first company which began to use silica instead of carbon black and developed the passenger tyre with RRC 8 N/kN and now prepared “proxima” tyre with RRC 6.5 N/kN.

“Michelin Green Meters” Press kit, 30 October, 2007 (www.michelin-green-meter.com)
So, if the new norm is set at the level, for example, of RR=12 N/kN while there are better tyres with RR=8 N/kN on the market, the consumer must be informed that the tyres he buys have RR value of just 8 N/kN.

The amendment to the Regulation #117 and the future proposal on the RR tyre labelling will help to achieve this goal.
Thank you for attention!
