Regulation No. 117 (Tyres rolling noise and wet grip adhesion)

Proposal for amendments to ECE/TRANS/WP.29/GRB/2010/3

The text reproduced below was prepared by the expert from France to introduce some corrections in the document ECE/TRANS/WP.29/GRB/2010/3 and to adjust some values remained between brackets. An explanation of the choice of these new values is provided in the appendix.

A. PROPOSAL

Annex 6 paragraph 2.2 (a), 3.4 table 2 note (a) and annex 6 appendix 1 paragraph 2.1:
Replace ISO 4000-1:[2009] by ISO 4000-1 2007

Annex 6 paragraph 3.2 table 1: correct to read

<table>
<thead>
<tr>
<th>Tyre Type Class</th>
<th>C1</th>
<th>C2 and C3</th>
<th>C3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load Index</td>
<td>All</td>
<td>Li = 121 and below</td>
<td>Li = 122 and above</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Li ≤ 121</td>
<td>Li &gt; 121</td>
</tr>
<tr>
<td>Speed Symbol</td>
<td>All</td>
<td>All</td>
<td>J 100 km/h and lower or tyres not marked with speed symbol</td>
</tr>
<tr>
<td>Speed</td>
<td>80</td>
<td>80</td>
<td>60</td>
</tr>
</tbody>
</table>

Annex 6 paragraph 4.4 table 3: correct to read

<table>
<thead>
<tr>
<th>Tyre Type Class</th>
<th>Class C1</th>
<th>Class C2 and C3 Li ≤ 121</th>
<th>Class C3 Li &gt; 121</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nominal Rim Diameter</td>
<td>All</td>
<td>All</td>
<td>&lt; 22.5</td>
</tr>
<tr>
<td>Warm Up Duration</td>
<td>30 min.</td>
<td>50 min.</td>
<td>550 min.</td>
</tr>
<tr>
<td></td>
<td>180 min.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Annex 6 paragraph 6.5 correct the formula

\[ n = \frac{(\sigma_{m,i}/x)^2}{\sigma_m/i}^2 = \frac{(\sigma_{m,i}/x)^2}{\sigma_m/i}^2 \]

Annex 8 paragraph 1: correct to read
1. This clause describes the procedure to be followed to perform inter-laboratory comparison. It can be used for determination of assigned values (see paragraph 3.1.3 below) for a set of reference tyres.

Annex 8 Add new paragraphs 2, 3 and 4

2. Any additional technical service wishing to refer to assigned values shall perform the same set of measurements than those participating to the inter laboratory comparison.

3. Any new measurements will not affect the current assigned values

4 The inter laboratory shall be repeated periodically (e.g. at every two years).

Annex 8 §1.2, Annex 9 § 1.1, §2.2, §4.1: Delete the word “predetermined”

Annex 9 paragraph 1.1: correct to read:

1.1. Alignment tyres

Set of at least 5 predetermined tyres measured by both the candidate and Technical Service machines to perform machine alignment.

Annex 9 paragraph 2.2: correct to read:

2.2. The machine alignment procedure requires at least 5 predetermined alignment tyres used by the candidate laboratory operating the machine. These tyres are used to align candidate machine(s) by comparing the measured Cr results to the ones obtained by a Technical Service eligible in the inter-laboratory comparison. An alignment formula is then established and shall be used to translate the results obtained on the candidate machine into aligned results.

Annexe 9 paragraph 4.1: correct to read:

4.1. The predetermined alignment tyres used to conduct the alignment procedure shall be identified to cover the needed usage range in terms of load index, Cr and Fr, Cr, dimensions, Fr and load index as follows:

(a) Cr values shall have a minimum range gap between two alignment tyres of:

- [3 N/kN] [1.5 +/- 0.5 N/kN] for Class C1 and C2 tyres, and
- [2 N/kN] [1.0 +/- 0.5 N/kN] for Class C3 tyres.

(b), (c), (d) are inchanged

The number of alignment tyres shall be equal to at least 5, i.e. there shall be:

- at least 5 alignment tyres for Class C1 and C2 tyres, and
[at least 5] alignment tyres for Class C3 tyres.

Annex 9 paragraph 5.1, 5.2, 5.3 replace “paragraph 4” by “paragraph 4 of annex 6” and “paragraph 3” by “paragraph 3 of annex 6”

Annex 9 paragraph 5.3 (a) and (b), correct to read:

(a) not greater than $0.05 \ N/kN$ for Class C1 and C2 tyres, and

(b) not greater than $0.06 \ N/kN$ for Class C3 tyres.

B. JUSTIFICATIONS

Annex 6:
- The current standard ISO 4000-1 is dated 2007 and not 2009. It exist a new draft for this standard but it is not yet voted.

- Table 1 and Table 3:
  - The replacement of “Tyre Type” by “Tyre Class” is in accordance with the definition (see § 2.4).
  - C3 has been added in the second column because some of current tyres of this class have a load index $\leq 121$
  - LI = 121 and below and LI=122 and above replaced respectively by LI$\leq 121$ and LI$>121$ is to be in coherence between the different tables.
  - Table 3: 150 min instead 550 min to be in coherence with ISO 28580

-§6.5: Index in the formula has to be in small letter and not in capital letter

Annex 8:
- §1: Error in the number of paragraph referred in the parenthesis.
- §2: This added paragraph is needed to include the case where a technical service wants to perform tests after the inter laboratory comparison is finished. It has to use the same set of samples in order to be compared with the other laboratories
- §3: This paragraph means that the assigned values are not modified if a technical service performs tests after the inter laboratory comparison.

Annex 8 §1.2, Annex 9 § 1.1, §2.2, 4.1: The word “predetermined” can be deleted because the manner to choose the tyres are well defined trough the range to be covered and the distribution of the tyres within the range (see the new paragraph 4.1).

Annex 9 § 1.1, 2.2and 4.1: During the different meetings of the STD informal group no consensus was obtained among the participants on the number of tyres to be used for the alignment process. For that reason, we try to show theoretically in the appendix of this informal document why a number of at least 5 tyres is needed to have a good precision in the alignment process. An additional
document including a demonstration made from experimental values could be tabled at the next GRB session to illustrate this requirement.

Annex 9 § 4.1 (a):
- Taking into account both the number of tyres used in the alignment process (at least 5) and the total usage range of the coefficients (e.g. 5.5 to 12 for C1 Tyre Class), we need to limit the gap between each alignment tyre in order to have a homogeneous distribution.

Annex 9 paragraph 5.1, 5.2, 5.3: The number of the annex has been added.

Annex 9 paragraph 5.3 (a) and (b): The values into brackets have been changed to be in coherence with the other parts of the document.
Appendix

According to the § 5.4 of the annex 9, the alignment process consists to establish a linear regression between two variables based on a regression model similar to:

\[ y_i = a + bx_i + \varepsilon_i \]

from which we are able to estimate the parameters “a” and “b” by “\( \hat{a} \)” and “\( \hat{b} \)”.

The standard deviation for a new predicted value \( \hat{y}_0 = \hat{a} + \hat{b}x_0 \) is given by the formula:

\[
\pm t \hat{\sigma} \sqrt{1 + \frac{1}{n} + \frac{1}{n} \sum_{i=1}^{n} (x_i - \bar{x})^2} \quad (1)
\]

\( \hat{\sigma} \) being an estimation of the repeatability standard deviation such as defined in § 5.3, the above quantity can be only reduced in increasing:

- “n” and

- the sum of square \( \sum_{i=1}^{n} (x_i - \bar{x})^2 \).

“n” represents in our case the number of alignment tyres and the sum of square represents the range of the data \( x_i \) that is to say the needed usage range.

By increasing “n” both quantity \( \frac{1}{n} \) and “t” value coming from the Student’s test, according to the table below, are decreasing.

| n value | Number of degrees of freedom | “t” such \( P(|T_{n-2}| > t) = 5\% \) |
|---------|------------------------------|-----------------------------------|
| 3       | 1                            | 12.7                              |
| 4       | 2                            | 4.3                               |
| 5       | 3                            | 3.2                               |
| 8       | 6                            | 2.4                               |
| 10      | 8                            | 2.3                               |
| 15      | 13                           | 2.2                               |

Considering that the impact of “t” is important in the relation (1) and looking at its variation versus the “n” values (see table above) there is a big interest to have the most important number of samples “n” to reduce the standard deviation of the predicted values. It seems that \( n \geq 5 \) could be a good compromise.
