Economic Commission for Europe
Inland Transport Committee
World Forum for Harmonization of Vehicle Regulations
Working Party on Noise
Sixtieth session
Geneva, 1-3 September 2014
Item 2 of the provisional agenda
Regulation No. 28 (Audible warning devices)

Proposal for amendments to Regulation No. 28

Submitted by the expert from the International Organization of Motor Vehicle Manufacturers*

The text reproduced below was prepared by the experts from the International Organization of Vehicle Manufacturers (OICA) in order to propose amendments to UN Regulation No. 28. The modifications to the current text are marked in bold for new and strikethrough for deleted characters.

* In accordance with the programme of work of the Inland Transport Committee for 2012–2016 (ECE/TRANS/224, para. 94 and ECE/TRANS/2012/12, programme activity 02.4), the World Forum will develop, harmonize and update Regulations in order to enhance the performance of vehicles. The present document is submitted in conformity with that mandate.
I. Proposal

Paragraph 14.4., amend to read:

"14.4. The A-weighted sound pressure level emitted by the device(s) fitted on the vehicle shall be measured at a distance of 7 m in front of the vehicle, the latter being placed on an open site¹, on ground as smooth as possible, and, in case of devices supplied with direct current, with its engine stopped. If the test voltage as specified in paragraph 6.2.3. cannot be reached, the test shall be performed on the vehicle with its engine warmed-up and at idle;"

Paragraph 14.8., amend to read:

"14.8. Measured under the conditions specified in paragraphs 14.2. to 14.7., the maximum sound-pressure level (14.7.) of the audible warning signal tested shall be at least:

(a) equal to 83 dB (A) and not more than 112 dB (A) for the signals of motor cycles of a power less than or equal to 7 kW;

(b) equal to 93 87 dB (A) and at most 112 dB (A) for the signals of vehicles of categories M and N² and motor cycles of a power greater than 7 kW."

II. Justification

A. Paragraph 14.4.

1. The test voltages as specified in 14.2 and respectively in 6.2.3 cannot be reached by the vehicles’ internal battery alone. The representative voltage for the operation of the horn is approximately reached, if the vehicle is warmed-up and can run at idle. Idle noise will not interfere with the measurement as it is more than 20 dB below the minimum required sound level.

B. Paragraph 14.8.

2. OICA proposes to change the minimum sound level requirement for vehicles of category M and N and motorcycles of a power greater than 7 kW from 93 dB to 87 dB. The basis for this proposal has been an assessment of the existing regulations on the horn (Annex I). In most countries the requirements are much less specific. It is generally required that a vehicle shall be equipped with a horn and that this horn shall be audible in a free field at a certain distance (typically 60 m to 100 m distance). One country that uses this requirement is the United States of America (USA). According to a review by the Society of Automotive Engineers (SAE) the typical sound level emitted by the horn in the USA is for more than

sixty per cent of the products below 93 dB (A), when measured according to UN Regulation No. 28.

3. A more specific example is given by the Korean Motor Vehicle Safety Standard (KMVSS), Article 53 (latest revision from 2003); the horn shall emit a sound level of at least 90 dB (C) at 2 m distance. The frequency range is the same as in UN Regulation No. 28 (1,800 Hz to 3,550 Hz). The correction for A-weighting and the distance will lead to an equivalent minimum sound level of approximately 86 dB(A). The KMVSS Article 53 is deemed to be equivalent in the Free Trade Agreement between the Republic of Korea and the European Union.

4. None of these countries consider the horn to be too quiet. So it can be concluded that by choosing 87 dB(A) as a minimum sound level, the horn will still be sufficiently audible.

III. Excerpts from UN Regulation No. 28 (paragraphs 6.2.3. and 14 consolidated)

... 6.2.3. The AWD shall be supplied with current, as appropriate, at the following voltages:

   6.2.3.1. in the case of AWDs supplied with direct current, at a voltage measured at the terminal of the electric power source of 13/12 of the rated voltage.

   6.2.3.2. in the case of AWDs supplied with alternating current, the current shall be supplied by an electric generator of the type normally used with this type of AWD. The acoustic characteristics of the AWD shall be recorded for electric generator speeds corresponding to 50%, 75% and 100% of the maximum speed indicated by the manufacturer of the generator for continuous operation. During this test, no other electrical load shall be imposed on the electric generator. The endurance test described in paragraph 6.3 shall be carried out at a speed indicated by the manufacturer of the equipment and selected from the above range.

... 14. SPECIFICATIONS

   The vehicle shall comply with the following specifications:

   14.1. The audible warning device(s) (or system) fitted on the vehicle shall be of a type approved under this Regulation. Audible warning Devices of class II approved under this Regulation in its original form, and therefore not bearing the approval symbol II in their approval mark, may continue to be fitted to vehicles types submitted for approval pursuant to this Regulation;

   14.2. The test voltage shall be as specified in paragraph 6.2.3. of the Regulation;

   14.3. The sound pressure measurements shall be made in the conditions specified in paragraph 6.2.2. of this Regulation;

   14.4. The A-weighted sound pressure level emitted by the device(s) fitted on the vehicle shall be measured at a distance of 7 m in front of the vehicle, the latter
being placed on an open site, on ground as smooth as possible, and, in case of
devices supplied with direct current, with its engine stopped. **If the test voltage
as specified in paragraph 6.2.3. cannot be reached, the test shall be
performed on the vehicle with its engine warmed-up and at idle;**

14.5. The microphone of the measuring instrument shall be placed approximately in
the mean longitudinal plane of the vehicle;

14.6. The sound pressure level of the background noise and wind noise must be at
least 10 dB (A) below the sound to be measured;

14.7. The maximum sound-pressure level shall be sought within the range of 0.5 and
1.5 m above the ground;

14.8. Measured under the conditions specified in paragraphs 14.2 to 14.7, the
maximum sound-pressure level (14.7) of the audible warning signal tested shall
be at least:

(a) equal to 83 dB (A) and not more than 112 dB (A) for the signals of
motor cycles of a power less than or equal to 7 kW.

(b) equal to 93 dB (A) and most 112 dB (A) for the signals of vehicles of
category M and N 1/ and motor cycles of a power greater than 7 kW.

---

3 The original footnotes will be renumbered and updated, where required, by the secretariat when
preparing a consolidated version of this Regulation.
