Proposal for Amendments of Regulation No. 9

The proposed amendments are written in track change mode, justifications are highlighted in yellow, comments are highlighted in green, references to ISO standards are highlighted in light blue. It should be checked by GRB members, whether these references need to be updated to newer versions of these standards.
Regulation No. 9

Uniform provisions concerning the approval of category L₂, L₄ and L₅ vehicles with regard to **sound emission**

Justification: The term “noise” was replaced by “sound” throughout the whole regulation except for background noise in order to bring it in line with other regulations (e.g. R 41, R 51).

1. Scope

This Regulation applies to vehicles of category L2, L4 and L5 \(^1\) with regard to noise sound emission.

2. Definitions

For the purposes of this Regulation,

2.1. "Approval of a vehicle" means the approval of a vehicle type with regard to the noise sound level and the original exhaust system as a technical unit of a vehicle type, falling under the scope of this regulation.

Justification: Makes the text more comprehensive.

2.2. "Vehicle type" means a category of motor vehicles which do not differ in such essential respects as:

2.2.1. The lines and constituent materials of the body (more particularly the engine compartment and its soundproofing);

2.2.2. The length and width of the vehicle;

2.2.3. The type of electric motor or engine (positive ignition or compression ignition; reciprocating or rotary piston; number and capacity of cylinders; number and type of carburettors or injection systems, arrangement of valves; rated maximum net power and rated engine speed).

Justification: The electric motor needs to be added in case of hybrid electric vehicles.

For rotary piston engines, the cubic capacity should be taken to be double of the volume of the chamber.

2.2.3.1. “Rated maximum net power”

For vehicles with a combustion engine rated maximum net power means the rated engine power as defined in ISO 4106:2004.

Comment: The latest version is ISO 4106:2011.

For vehicles with an electric motor “rated maximum net power” means the maximum thirty minutes power at the output shaft of an electric engine as set out in UNECE Regulation No 85. “Rated maximum net power” means the rated engine power as defined in ISO 4106:2004.

The symbol \(P_a\) denotes the numerical value of the rated maximum net power expressed in kW.

Justification: Amendment necessary in order to cover also hybrid electric vehicles.

\(^1\) As defined in the Consolidated resolution on the Construction of vehicles (R.E.3), document ECE/TRANS/WP.29/78/Rev.2, para.2.
2.2.3.2. "Rated engine speed" means the engine speed at which the engine develops its rated maximum net power as stated by the manufacturer.\(^2\)

The symbol \(n_{\text{rated}}\) denotes the rated engine speed expressed in \(\text{min}^{-1}\).

**Justification:** The term "s" for rated engine speed was replaced by the term \(n_{\text{rated}}\) in order to avoid misinterpretations.

2.2.3.3 "Idling speed"

The idling speed shall be measured over a period of at least 1 minute at a sampling rate of at least 1 Hz with the engine running in warm condition, the gear lever placed in neutral, and the clutch engaged. The conditions for temperature, peripherals, auxiliaries, etc shall be the same as described in Annex 3.

The idling speed is determined by the arithmetic average over the measuring period, rounded or truncated to the nearest 10 \(\text{min}^{-1}\).

The symbol \(n_{\text{idle}}\) denotes the idling speed expressed in \(\text{min}^{-1}\).

**Justification:** \(n_{\text{idle}}\) will be used for additional sound emission provision requirements and was thus added to the definitions. The determination of the idling speed was taken over from GTR #15 (WLTP).

2.2.4. Drive train, in particular the number and ratios of the gears of the transmission and the final ratio.

**Number and ratios of gears.**

**Justification:** The proposed text is more comprehensive than the existing text.

2.2.5. The number, type and arrangement of exhaust systems.

2.3. "Exhaust or silencing system(s)" means a complete set of components necessary for limiting the noise made by a motor vehicle and its exhaust.

2.3.1. "Original exhaust or silencing system” means a system of the type with which the vehicle is equipped on acceptance or extension of acceptance. It may be part of the original equipment or a replacement.

2.4. "Exhaust or silencing systems of different types” means exhaust or silencing systems which differ in such essential respects as:

2.4.1. That their components bear different trade names or marks;

2.4.2. That the characteristics of the materials constituting a component are different or that the components differ in shape or size;

2.4.3. That the operating principles of at least one component are different;

2.4.4. That their components are assembled differently.

2.5. "Exhaust or silencing system component” means one of the individual constituent parts whose assembly constitutes the exhaust or silencing system.\(^3\)

---

\(^2\) If the rated maximum net power is reached at several engine speeds, the rated engine speed is used in this Regulation as the highest engine speed at which the rated maximum net power is reached.
If the engine is fitted with an intake device (air filter and/or an intake sound absorber essential in order to ensure conformity with sound level limits), this device shall be considered to be a component of the same importance as the exhaust system proper, and be included in the list referred to in paragraph 3.2.2. below and carry the markings prescribed in paragraph 4.1. below.

**Justification:** The text above was copied from Regulation 63 and will improve Regulation 9.

2.6. "Kerb–Reference mass" (as defined in section 4.1.2. of ISO 6726: 1988) means the mass of the vehicle ready for normal operation and fitted with the following equipment:

**Justification:** The term “kerb mass” was replaced by “reference mass “, in order to make the regulation more comprehensive.

(a) Full electrical equipment including the lighting and signalling devices supplied by the manufacturer;

(b) All instruments and fittings required by any legislation in respect of which a measurement of the vehicle dry mass is being made;

(c) Full complement of liquids to ensure the correct functioning of every part of the vehicle and the fuel tank filled at least to 90 per cent of the capacity specified by the manufacturer;

(d) Auxiliary equipment usually supplied by the manufacturer in addition to that necessary for normal operation (tool-kit, carrier(s), windscreen(s), protective equipment, etc.)

The symbol \( m_{ref} \) denotes the reference mass expressed in kg.

**Notes:**

1. In the case of a vehicle which operates on a fuel/oil mixture:

1.1. Where the fuel and oil are premixed, the word "fuel" is interpreted as including such a pre-mixture of fuel and oil;

1.2. Where the fuel and oil are separately measured, the word "fuel" is interpreted as including only the petrol. The "oil", in this case, is already included in subparagraph (c) of this paragraph.

2.7 “Test mass”

The test mass is the reference mass plus the combined mass of the driver and test equipment.

The combined mass of the driver and test equipment used on the vehicle shall not be more than 90 kg nor less than 70 kg. Weights shall be placed on the vehicle, if the 70 kg minimum is not reached.

The symbol \( m \) denotes the test mass expressed in kg.

---

3 These components are, in particular, the exhaust manifold, the exhaust piping, the expansion chamber, the silencer proper, etc. If the engine intake is equipped with an air filter and the filter's presence is essential to ensure observance of the prescribed sound-level limits, the filter must be regarded as a component of the "exhaust or silencing system(s)" and bear the marking prescribed in paragraphs 3.2.2. and 4.1.
Adding the term “test mass” to the definitions makes the text in annex 3 more comprehensive.

2.78. “Maximum vehicle speed” means the maximum vehicle design speed as defined and measured according to ISO 7116:1995 for L2 category vehicles and according to ISO 7117:1995 for L4 and L5 category vehicles.

The symbol \( v_{\text{max}} \) denotes the maximum vehicle speed expressed in km/h.

Justification: The existing text does not cover L2 category vehicles appropriately.

Comment 1. The latest versions of the ISO Standards are ISO 7117:2010 and ISO 7116:2011 and it needs to be checked whether L2 and L5 category vehicles are covered by these Standards.

Comment 2. A reference to ECE Regulation 68 could be used for vehicles with a driver cabin. For vehicles without a driver cabin additional requirements for the driver have to be added for a reference to Regulation 68.

2.9 “Power-to-mass ratio index” means the ratio of the rated maximum net power of a vehicle as defined in paragraph 2.2.3.1 above to its mass. It is defined as:

\[
\text{PMR} = \left( \frac{P_{\text{ref}}}{m_{\text{ref}} + 75} \right) \times 1000
\]

Where

\( P_{\text{ref}} \) is the maximum rated net power as defined in paragraph 2.2.3.1 above.

In case of a hybrid electric vehicle \( P_{\text{ref}} \) is the sum of the maximum rated net power of the combustion engine and the maximum thirty minutes power of the electric motor.

\( m_{\text{ref}} \) is the numerical value of the reference mass as defined in paragraph 2.6 above, expressed in kilograms.

The symbol PMR denotes the power-to-mass ratio index.

Justification: The PMR index was added to the definitions, because it is required for the additional sound emission provisions.

3. Application for approval

3.1. The application for approval of a vehicle type with regard to noise shall be submitted by its manufacturer or by his duly accredited representative.

3.2. It shall be accompanied by the under mentioned documents in triplicate and the following particulars:

3.2.1. A description of the vehicle type with regard to the items mentioned in paragraph 2.2. above. The numbers and/or symbols identifying the engine type and the vehicle type shall be specified;

3.2.2. A list of the components, duly identified, constituting the exhaust or silencing system;

3.2.3. A drawing of the assembled exhaust or silencing system and an indication of its position on the vehicle;

3.2.4. Detailed drawings of each component to enable it to be easily located and identified, and a specification of the materials used.
3.3. At the request of the Technical Service conducting approval tests, the vehicle manufacturer shall, in addition, submit a sample of the exhaust or silencing system.

3.4. A vehicle representative of the vehicle type to be approved shall be submitted to the Technical Service conducting approval tests.

4. Markings

4.1. The components of the exhaust or silencing system shall bear at least the following identifications marks:

4.1.1. The trade name or mark of the manufacturer of the exhaust or silencing system and of its components;

4.1.2. The trade description given by the manufacturer;

4.1.3. The identifying part numbers;

4.1.4. For all original silencers, the "E" mark followed by the identification of the country which granted the component type approval.\(^4\)

4.1.5. Any packing of original replacement exhaust or silencing systems shall be marked legibly with the words "original part" and the make and type references integrated together with the "E" mark and also the reference of the country of origin.

4.1.6. Such markings shall be indelible, clearly legible and also visible, in the position at which it is to be fitted to the vehicle.

5. Approval

5.1. If the vehicle type submitted for approval pursuant to this Regulation meets the requirements of paragraphs 6. and 7. below, approval of that vehicle type shall be granted.

5.2. An approval number shall be assigned to each type approved. Its first two digits (at present 07 corresponding to the 07 series of amendments which entered into force on 3 November 2013) shall indicate the series of amendments incorporating the most recent major technical amendments made to the Regulation at the time of issue of the approval. The same Contracting Party shall not assign the same number to the same vehicle type equipped with another type of exhaust or silencing system or to another vehicle type.

\(^4\) The distinguish numbers of the Contracting Parties to the 1958 Agreement are reproduced in Annex 3 to the Consolidated Resolution on the Construction of Vehicles (R.E.3), document ECE/TRANS/WP.29/78/Rev.2/Amend.3.
5.3. Notice of approval or of extension or refusal of approval of a vehicle type pursuant to this Regulation shall be communicated to the Parties to the Agreement which apply this Regulation by means of a form conforming to the model shown in Annex 1 to this Regulation and of drawings of the exhaust or silencing system (supplied by the applicant for approval) in a format not exceeding A4 (210 x 297 mm), or folded to that format, and on an appropriate scale.

5.4. There shall be affixed, conspicuously and in a readily accessible place specified on the approval form, to every vehicle conforming to a vehicle type approved under this Regulation an international approval mark consisting of:

5.4.1. A circle surrounding the letter "E" followed by the distinguishing number of the country which has granted approval; and

5.4.2. The number of this Regulation, followed by the letter "R", a dash and the approval number, to the right of the circle prescribed in paragraph 5.4.1. above.

5.5. If the vehicle conforms to a vehicle type approved, under one or more other Regulations annexed to the 1958 Agreement, in the country which has granted approval under this Regulation, the symbol prescribed in paragraph 5.4.1. above need not be repeated; in such a case the additional numbers and symbols of all the Regulations under which approval has been granted in the country which has granted approval under this Regulation shall be placed in vertical columns to the right of the symbol prescribed in paragraph 5.4.1. above.

5.6. The approval mark shall be clearly legible and be indelible.

5.7. The approval mark shall be placed close to or on the vehicle data plate.

5.8. Annex 2 to this Regulation gives examples of arrangements of approval marks.

6. Specifications

6.1. General specifications

6.1.1. The vehicle, its engine and its exhaust or silencing system shall be so designed, constructed and assembled as to enable the vehicle, in normal use, despite the vibration to which it may be subjected, to comply with the provisions of this Regulation.

6.1.2. The exhaust or silencing system shall be so designed, constructed and assembled as to be able to resist the corrosive action to which it is exposed.

6.1.3. The following information shall be provided on the motor vehicle in an easily accessible but not necessarily immediately visible location:

(a) The manufacturer's name;

(b) The target engine speed and the final result of the stationary test as defined in paragraph 3.2. of Annex 3.

6.2. Specifications regarding sound levels

6.2.1. Methods of measurement
6.2.1.1. The noise sound made by the vehicle type submitted for approval shall be measured by the two methods described in Annex 3 to this Regulation for the vehicle in motion and for the vehicle when stationary; in the case of a vehicle with an electric motor or with where an internal combustion engine that does not operate when the vehicle is stationary, the emitted noise sound shall only be measured when the vehicle is in motion.

Justification: The text should also cover hybrid electric vehicles.

6.2.1.2. The two values measured in accordance with the provisions of paragraph 6.2.1.1. above shall be entered in the test report and on a form conforming to the model in Annex 1 to this Regulation.

6.2.1.3. The sound level determined by the method described in paragraph 3.1. of Annex 3 to this Regulation when the vehicle is in motion shall not exceed the limits prescribed (for new vehicles and new exhaust or silencing systems) in Annex 4 to this Regulation for the category to which the vehicle belongs. The sound level measured by the method described in paragraph 3.1. of Annex 3 to this Regulation, when the vehicle is in motion, shall not exceed (for new vehicles and new exhaust or silencing system(s)) 80 dB(A) for categories L4 and L5 and 76 dB(A) for category L2.

Justification: The sound limit values were put into a table in a new annex 4 for alignment reasons with other regulations (e.g. R 63 and R 41-04).

6.3. Additional prescriptions requirements related to tamperability and manually adjustable multi-mode exhaust or silencing systems

Comment: The text in 6.3.1, 6.3.2 and 6.3.3 is in line with ECE R41

6.3.1. Tampering protection provisions

All exhaust or silencing systems shall be constructed in a way that does not easily permit removal of baffles, exit-cones and other parts whose primary function is as part of the silencing/expansion chambers. Where incorporation of such a part is unavoidable, its method of attachment shall be such that removal is not facilitated easily (e.g. with conventional threaded fixings) and should also be attached such that removal causes permanent/irrecoverable damage to the assembly.

6.3.2. Manually adjustable multi-mode exhaust or silencing systems

Exhaust or silencing systems with multiple, manually adjustable operating modes shall meet all requirements in all operating modes. The reported noise levels shall be those resulting from the mode with the highest noise levels.

6.3.3. Prohibition of defeat devices

The vehicle manufacturer shall not intentionally alter, adjust or introduce any device or procedure solely for the purpose of fulfilling the noise emission requirements of this Regulation, which will not be operational during typical on-road operation.

Justification: The added headers make the text more comprehensive.

5 A test is made on a stationary vehicle in order to provide a reference value for administrations which use this method to check vehicles in use.
6.3.4 Additional sound emission provisions

Comment: The following requirement was copied from ECE R51-03.

6.3.4.1 The sound emission of the vehicle under typical on-road driving conditions, which are different from those under which the type-approval test set out in Annex 3 was carried out, shall not deviate from the test results in a significant manner.

6.3.4.1.1 Vehicles of category L2

The requirement of paragraph 6.3.4.1 is deemed to be fulfilled, if the sound emission at maximum vehicle speed according to the measurement procedure described in paragraph 3.1 of annex 3 does not exceed the limit value prescribed in Annex 4 to this Regulation for the category to which the vehicle belongs by more than [x] dB(A).

6.3.4.1.2 Vehicles of category L4 and L5

The requirements of annex 6 to this Regulation shall be fulfilled.

6.3.5 If the vehicle has user selectable software programs or modes which affect the sound emission of the vehicle, all these modes shall be in compliance with the requirements in paragraph 6.3.4.1 or annex 6. Testing shall be based on the worst case scenario.

6.3.6 In the application for type approval or for modification or extension of a type approval the manufacturer shall provide a statement in accordance with Annex 7 that the vehicle type to be approved complies with the requirements of paragraphs 6.3 of this Regulation.

6.3.7 The responsible authority may carry out any test prescribed in this Regulation.

Justification: Additional sound emission provisions should be applied to all L category vehicles and not be restricted to high powered L3 category vehicles only.

For L2 category vehicles the same requirements are proposed as for L1 category vehicles in the amendments for Regulation 63, because both categories have similar engines and transmissions.

For L4 and L5 category vehicles it is not an easy task to propose ASEP on a short time base. One should remember that a lot of measurements dedicated to ASEP were performed and analysed in an iterative process for the development of the provisions in regulation 41-04.

One could take over the approach from regulation 41-04, but the measurement results of annex 3 are not compatible for Regulations 9 and 41-04, because driving conditions and gear use are completely different. Regulation 9 still uses the methods of the previous version of regulation 41.

Furthermore, regulation 41-04 uses a \( n_{w_{90}} \)-dependent L\( w_{10} \) limit curve as threshold for ASEP tests. It is completely impossible to transform this curve to a regulation 9 compliant system.

In order to nevertheless make a proposal on a short time base, the approach for the control range for ASEP in regulation 41-04 was taken as basis for the proposal. This implies that the assumption is justified, that L4 and L5 category vehicles of a specific power to mass ratio have similar engine speed distributions in real traffic and the same power to mass ratio dependency as L3 category vehicles. This needs of course to be verified or validated or at least further assessed.
The objective of this proposal is to determine the sound emission for a full load acceleration test where $n_{\text{ult}}$ corresponds to the upper engine speed boundary (95 percentile) derived from in-use data in addition to the annex 3 results.

In regulation 41-04 ASEP is only applied to vehicles with a power to mass ratio index PMR > 50. For regulation 9 this restriction was skipped, because it would not be reasonable to require ASEP for L1 and L2 category vehicles, but not for L4 and L5 category vehicles with PMR ≤ 50, but still higher PMR values than for L1 category vehicles.

7. **Modification and extension of approval of a vehicle type or a type of exhaust or silencing system(s)**

7.1. Every modification of the vehicle type or of the exhaust or silencing system shall be notified to the Type Approval Authority which approved the vehicle type. The said Authority may then either:

7.1.1. Consider that the modifications made are unlikely to have an appreciable adverse effect; or

7.1.2. Require a further test report from the Technical Testing Service.

7.2. Confirmation or refusal of approval, specifying the alterations, shall be communicated to the Parties to the Agreement applying this Regulation in accordance with the procedure specified in paragraph 5.3. above.

7.3. The Type Approval Authority issuing the extension of approval shall assign a series number for such an extension and inform thereof the other Contracting Parties to the 1958 Agreement applying this Regulation by means of a communication form conforming to the model given in Annex 1 to this Regulation.

8. **Conformity of production**

The conformity of production procedures shall comply with those set out in the Agreement, Appendix 2 (E/ECE/324-E/ECE/TRANS/505/Rev.2), with the following requirements:

8.1. Every vehicle bearing an approval mark as prescribed under this Regulation shall conform to the vehicle type approved, be fitted with the exhaust or silencing system(s) with which it was approved and satisfy the requirements of paragraph 6. above.

8.2. In order to verify conformity as prescribed in paragraph 8.1. above, a vehicle, bearing the approval mark required by this Regulation, shall be taken from the series. Production shall be deemed to conform to the requirements of this Regulation if the levels measured using the method described in Annex 3 do not exceed by more than 3 dB(A) the value measured on acceptance, nor by more than 1 dB(A) the limits prescribed in paragraph 6.2.1.3. above.
9. **Penalties for non-conformity of production**

9.1. The approval granted in respect of a vehicle type pursuant to this Regulation may be withdrawn if the requirements laid down in paragraph 8. above are not complied with, or if the vehicle fails to pass the tests provided for in paragraph 8.2. above.

9.2. If a Party to the Agreement which applies this Regulation withdraws an approval it has previously granted, it shall forthwith so notify the other Contracting Parties applying this Regulation by means of a communication form conforming to the model given in Annex 1 to this Regulation.

10. **Production definitively discontinued**

If the holder of the approval completely ceases to manufacture a vehicle or a exhaust or silencing system approved in accordance with this Regulation, he shall so inform the Type Approval Authority which had granted the approval. Upon receiving the relevant communication, that Authority shall inform thereof the other Parties to the Agreement applying this Regulation by means of a communication form conforming to the model given in Annex 1 to this Regulation.

11. **Transitional provisions**

Comment: Transitional provisions shall be amended in a second step once the amendments of this document have been approved. These amendments shall include transitional provisions for the change from annex 3 to the reference to ISO 10844:2014 for the test track surface specifications.

11.1. As from the official date of entry into force of the 07 series of amendments, no Contracting Party applying this Regulation shall refuse to grant or refuse to accept type approvals under this Regulation as amended by the 07 series of amendments.

11.2. As from 24 months after the date of entry into force of the 07 series of amendments, Contracting Parties applying this Regulation shall grant type approvals only if the vehicle type to be approved meets the requirements of this Regulation as amended by the 07 series of amendments.

11.3. Contracting Parties applying this Regulation shall not refuse to grant extensions of type approvals for existing types which have been granted according to the preceding series of amendments to this Regulation.

11.4. Until 24 months after the date of entry into force of the 07 series of amendments to this Regulation, no Contracting Party applying this Regulation shall refuse national or regional type approval of a vehicle type-approved to the preceding series of amendments to this Regulation.

11.5. As from 24 months after the date of entry into force of the 07 series of amendments to this Regulation, Contracting Parties applying this Regulation shall not be obliged to accept, for the purpose of national or regional type approval, a vehicle type approved to the preceding series of amendments to this Regulation.
11.6. Notwithstanding the transitional provisions above, Contracting Parties whose application of this Regulation comes into force after the date of entry into force of the most recent series of amendments are not obliged to accept type approvals which were granted in accordance with any of the preceding series of amendments to this Regulation are only obliged to accept type approval granted in accordance with the 07 series amendments.

12. **Names and addresses of Technical Services responsible for conducting approval tests, and of Type Approval Authorities**

The Parties to the Agreement which apply this Regulation shall communicate to the United Nations Secretariat the names and addresses of the Technical Services responsible for conducting approval tests and of the Type Approval Authorities which grant approval and to which forms certifying approval or extension or refusal or withdrawal of approval or production definitively discontinued, issued in other countries, are to be sent.

Annex 2

Arrangements of the approval mark

Model A
(See paragraph 5.4. of this Regulation)

The above approval mark affixed to a vehicle shows that the vehicle type concerned has, with regard to its noise emission, been approved in the Netherlands (E 4) pursuant to Regulation No. 9 under approval No. 072439. The approval number indicates that the approval was granted according to the requirements of Regulation No. 9 as amended by the 07 series of amendments.

Model B
(See paragraph 5.5. of this Regulation)

The above approval mark affixed to a vehicle shows that the vehicle type concerned has been approved in the Netherlands (E 4) pursuant to Regulations Nos. 9 and 33. The approval numbers indicate that, at the date when the respective approvals were given, Regulation No. 9 included the 07 series of amendments and Regulation No. 33 was still in its original form.

---

1 The second number is given merely as an example.
Methods and instruments for measuring the noise emitted by motor vehicles

1. Measuring instruments

1.1. General

The apparatus used for measuring the sound pressure level shall be a sound level meter or equivalent measuring system meeting the requirements of Class 1 instruments (inclusive of the recommended windscreen, if used). These requirements are described in IEC 61672-1:2002. Measurements shall be carried out using the time weighting “F” of the acoustic measuring instrument and the “A” frequency weighting curve also described in IEC 61672-1:2002. When using a system that includes periodic monitoring of the A-weighted sound pressure level, a reading should be made at a time interval not greater than 30 ms. The instruments shall be maintained and calibrated in accordance with the instructions of the instrument manufacturer.

1.2. Calibration

At the beginning and at the end of every measurement session, the entire acoustic measuring system shall be checked by means of a sound calibrator that fulfils the requirements of Class 1 sound calibrators according to IEC 60942:2003. Without any further adjustment, the difference between the readings shall be less than or equal to 0.5 dB(A). If this value is exceeded, the results of the measurements obtained after the previous satisfactory check shall be discarded.

1.3. Compliance with requirements

Compliance of the sound calibrator with the requirements of IEC 60942:2003 shall be verified once a year. Compliance of the instrumentation system with the requirements of IEC 61672-1:2002 shall be verified at least every 2 years. All compliance testing shall be conducted by a laboratory which is authorized to perform calibrations traceable to the appropriate standards.

1.4. Instrumentation for speed measurements

The rotational speed of the engine shall be measured with an instrument meeting specification limits of at least ±2 per cent or better at the engine speeds required for the measurements being performed.

The road speed of the vehicle shall be measured with instruments meeting specification limits of at least ±0.5 km/h when using continuous measuring
devices. If testing uses independent measurements of vehicle speed, this instrumentation shall meet specification limits of at least ±0.2 km/h.\(^1\)

1.5. Meteorological instrumentation

The meteorological instrumentation used to monitor the environmental conditions during the test shall meet the following specifications:

- ±1 °C or less for a temperature measuring device;
- ±1.0 m/s for a wind speed measuring device;
- ±5 hPa for a barometric pressure measuring device;
- ±5 per cent for a relative humidity measuring device.

2. Conditions of measurement

2.1. Test site, weather conditions and background sound level correction

2.1.1. Test site

The test site shall consist of a central acceleration track surrounded by a substantially level test area. The test track shall be level; the track surface shall be dry and so designed that tyre sound remains low.

On the test site, free sound field conditions shall be maintained to within ±1 dB between the sound source placed in the middle of the acceleration section and the microphone. This condition shall be deemed to be met if there are no large sound-reflecting objects such as fences, rocks, bridges or buildings within 50 m of the centre of the acceleration section. The surface of the test track shall conform to the requirements of Annex 4 to this Regulation.

No obstacle likely to affect the sound field shall be close to the microphone and no one shall come between the microphone and the sound source. The observer taking the measurements shall take up position so as to avoid influencing the metre readings.

Comment: The following amendment was taken over from ECE/TRANS/WP.29/GRB/2015/5.

The surface of the test track shall conform to the requirements of Annex 5 to this Regulation or be in accordance to ISO10844:2014. After the end of the period indicated in paragraph 11 of this Regulation only ISO 10844:2014 shall be used as reference.

2.1.2. Weather conditions and background noise correction

Measurements shall not be made in poor weather conditions. The tests shall not be carried out if the wind speed, including gusts, exceeds 5 m/s during the sound-measurement interval.

For measurement purposes, the weighted sound level (A) of sound sources other than on the test vehicle and the sound-level produced by the effect of the wind shall be at least 10 dB(A) below the sound level produced by the vehicle.

---

\(^1\) Independent measurements of vehicle speed are when two or more separate devices will determine the values of \(v_{AA}'\) and \(v_{BB}'\). A continuous measuring device such as radar will determine all required vehicle speed information with one device.
The microphone may be fitted with a suitable wind-guard, provided that its influence on the sensitivity and directional characteristics of the microphone are taken into account.

If the difference between ambient and measured sound levels is between 10 and 15 dB(A), in order to calculate the test result the appropriate correction shall be subtracted from the readings on the sound level meter, as given in Table 1.

Table 1
Correction applied to individual measured test value

<td>0.0</td>
</tr>
</tbody>
</table>

Justification: The subparagraphs of paragraphs 2.1 were restructured and amended in order to make the text more comprehensive.

The figure above was deleted because it is in contradiction to Table 1.

The test track surface specifications in paragraph 2.1.1 were amended in order to allow the transition from the requirements of ISO 10844:1994 to the requirements to ISO 10844:2014. The requirements of ISO 10844:1994 are covered by annex 5 of this Regulation, but these are proposed to be replaced in the future by the requirements of ISO 10844:2014, which are more stringent and will reduce the variations between different test tracks. In such a case, since the structure of both versions of the ISO standards is significantly different, annex 5 should be replaced by a reference to the ISO standard (ISO 10844:2014).

2.12. Condition of the vehicle

2.12.1. General conditions
The vehicle shall be supplied as specified by the vehicle manufacturer.

Before the measurements are started, the vehicle shall be brought to its normal operating conditions as regards:

- Temperatures;
- Tuning;
- Fuel;
- Sparking plugs, carburettor(s), etc., (as appropriate).

If the vehicle is fitted with fans with an automatic actuating mechanism, this system shall not be interfered with during the sound measurements.

If the vehicle is equipped with devices which are not necessary for its propulsion, but which are used whilst the vehicle is in normal service on the road, those devices shall be in operation in accordance with the specifications of the manufacturer.

For vehicles having more than one driven wheel, only the drive provided for normal road operation may be used. If the vehicle is fitted with a trailer or a semi-trailer, this shall be removed for the purposes of the test.

The tests shall not be carried out if the wind speed, including gusts, exceeds 5 m/s during the sound measurement interval.

2.2. Test mass and tyre selection

2.2.1. The vehicle shall be tested with its test mass as defined in paragraph 2.7 of this regulation. **Test mass of the vehicle**

Measurements shall be made on vehicles at the following test mass \( m_t \), in kg, specified as:

\[ m_t = m_{kerb} \pm 75 \pm 5 \text{ kg} \]

where:

- 75 \pm 5 kg equates to mass of the driver and instrumentation

\[ m_{kerb} = \text{kerb mass} \]

2.2.2. Tyre selection and condition

The tyres shall be appropriate for the vehicle and shall be inflated to the pressure recommended by the vehicle manufacturer for the test mass of the vehicle.

The tyres shall be selected by the vehicle manufacturer, and correspond to one of the tyre sizes and types designated for the vehicle by the vehicle manufacturer. The minimum tread depth shall be at least 80 per cent of the full tread depth.

2.2. The test site shall consist of a central acceleration track surrounded by a substantially level test area. The test track shall be level; the track surface shall be dry and so designed that tyre noise/sound remains low.

On the test site, free sound field conditions shall be maintained to within ±1 dB between the sound source placed in the middle of the acceleration section and the microphone. This condition shall be deemed to be met if there are no large
sound-reflecting objects such as fences, rocks, bridges or buildings within 50 m of the centre of the acceleration section. The surface of the test track shall conform to the requirements of Annex 4 to this Regulation.

No obstacle likely to affect the sound field shall be close to the microphone and no one shall come between the microphone and the sound source. The observer taking the measurements shall take up position so as to avoid influencing the metre readings.

2.3. Miscellaneous

Measurements shall not be made in poor weather conditions.

For measurement purposes, the weighted sound level (A) of sound sources other than on the test vehicle and the sound level produced by the effect of the wind shall be at least 10 dB(A) below the noise sound level produced by the vehicle. The microphone may be fitted with a suitable wind guard, provided that its influence on the sensitivity and directional characteristics of the microphone are taken into account.

If the difference between ambient and measured noise sound levels is between 10 and 15 dB(A), in order to calculate the test result the appropriate correction shall be subtracted from the readings on the sound level meter, as given in Table 1.

3. Methods of measurement

3.1. Measurement of the sound emission of the vehicles in motion

3.1.1. Test arrangement and microphone positions

3.1.1.1. The test arrangement is shown in figure 1. Two lines, AA' and BB', parallel to the microphone line PP' and situated respectively 10 m forward and 10 m rearward of that line shall be marked out on the test track.

3.1.1.2. The distance of the microphone positions from the line CC', on the microphone line PP', perpendicular to the reference line CC' on the test track (see Figure 1), shall be 7.5 ± 0.05 m. The microphones shall be located 1.2 ± 0.02 m above the ground level. The reference direction for free-field conditions (see IEC 61672-1:2002) shall be horizontal and directed perpendicularly towards the path of the vehicle line CC'.

Two lines, AA' and BB', parallel to the microphone line PP' and situated respectively 10 m forward and 10 m rearward of that line shall be marked out on the test track.

Figure 1: Measuring positions for vehicles in motion
3.1.2 Acceleration test execution, approach vehicle speed and gear use

3.1.2.1 The vehicle shall approach line AA’ at an initial steady vehicle speed \( v_{AA'} \) as specified below. When the front of the vehicle reaches line AA’ the accelerator handle shall be fully opened as quickly as practically possible and kept in that position until the rear of the vehicle reaches the line BB’; the accelerator handle shall then be returned as quickly as possible to the idle position. The vehicle speed achieved, when the rear of the vehicle reaches the line BB’ is called \( v_{BB'} \).

The engine speeds corresponding to \( v_{AA'} \) and \( v_{BB'} \) in a specific test condition are called \( n_{AA'} \) and \( n_{BB'} \).

In the case of articulated vehicles consisting of two non-separable units regarded as a single vehicle, the semi-trailer shall be disregarded in determining when line BB’ is crossed.

For hybrid vehicles, the tests shall be performed twice under the following conditions:

(a) condition A: batteries shall be at their maximum state of charge; if more than one ‘hybrid mode’ is available, the most electric hybrid mode shall be selected for the test;

(b) condition B: batteries shall be at their minimum state of charge; if more than one ‘hybrid mode’ is available, the most fuel-consuming hybrid mode shall be selected for the test.

For all measurements, the vehicle shall be driven in a straight line along the test track in such a way that the track of the median longitudinal plane of the vehicle is as close as possible to the line CC’.

3.1.2.2 Determination of the approach vehicle speed and the gear use

3.1.2.2.1 Vehicle with no gearbox

The vehicle shall approach line AA’ at a steady vehicle speed \( v_{AA'} \) corresponding either, in terms of engine speed, (min\(^{-1}\)) to 75 per cent of the rated engine speed as defined in paragraph 2 of this regulation, or to 75 per cent of the maximum engine speed permitted by the governor, or to 50 km/h, whichever is the lowest.

3.1.2.2.2 Vehicle with a manually-operated gearbox

Vehicles with manual transmissions, automatic transmissions, or transmissions with continuously variable transmission ratios (CVT’s) tested with locked gears

**Comment:** The text above is copied from Regulation 41-04.

If the vehicle is fitted with a dual mode transmission (e.g. low and high), the mode for normal on-road operation shall be selected.

**Comment:** This issue is not covered by Regulation 41-04.

If the vehicle is fitted with a gearbox with two or three or four forward gears or the same number of lockable gears in automatic transmission or in CVT, the second gear shall be used. If the gearbox has more than four forward gears or the same number of lockable gears in automatic transmission or in CVT, the third gear shall be used.

The vehicle shall approach line AA’ at a steady vehicle speed \( v_{AA'} \) corresponding either, in terms of engine speed, to 75 per cent of the rated engine speed as defined in paragraph 2.2.3.2 of this regulation or to 75 per cent...
of the maximum engine speed permitted by the governor, or to 50 km/h, whichever is the lowest.

If, by following the above procedure, the engine speed $n_{BB'}$, achieved when the rear of the vehicle passes the line $BB'$, exceeds the rated engine speed as defined in paragraph 2.2.3.2 of this regulation, the first higher gear (or locked gear) which ensures that the rated engine speed is no longer exceeded up to the line $BB'$ of the measurement area should be used instead of the second or third gear.

Auxiliary step-up ratios ("overdrive") shall not be engaged.

3.1.2.3. **Vehicle with an automatic transmission** Vehicles with automatic transmissions, adaptive transmissions or transmissions with variable transmission ratios tested with non-locked gears

The gear selector position for full automatic operation shall be used.

Where several full automatic operation modes are available (e.g. economic, sporty), that mode shall be selected which results in the highest average acceleration of the vehicle between lines $AA'$ and $BB'$.

The test may then include a gear change to a lower gear and a higher acceleration. A gear change to a higher gear and a lower acceleration is not allowed. In any case, a gear change to a gear which is typically not used at the specified condition in urban traffic shall be avoided.

Therefore, it is permitted to establish and use electronic or mechanical devices, including alternative gear selector positions, to prevent a downshift to a gear which is typically not used at the specified test condition in urban traffic. The functionality of the devices shall be described in the communication form.

**Comment:** The text above is copied from Regulation 41.44 and modified to fit the demands of this Regulation.

The vehicle shall approach the line $AA'$ at a steady vehicle speed $v_{AA'}$ of 50 km/h or at 75 per cent of its maximum vehicle speed as defined in paragraph 2.8 of this Regulation, whichever is the lower.

3.1.3 **Sound level determination**

**Comment:** The following amendments are proposed according to ECE R 41.

The maximum sound level recorded at each side of the vehicle shall be reduced by 1 dB(A) to account for measurement inaccuracy and mathematically rounded to the nearest first decimal place (e.g. XX.X). These values constitute the results of the measurement.

The measurement will be invalid if an abnormal discrepancy is recorded between the peak value and the general sound level.

At least two measurements shall be made on each side of the vehicle.

The measurements shall be considered valid if the difference between the results of the two consecutive measurements on the same side of the vehicle is not more than 2 dB(A).

Preliminary measurements may be made for adjustment purposes, but shall be disregarded for the determination of the measurement results.

3.1.4 **Calculation of the final test result**
The final test result is the average of the four test results rounded off to the nearest whole decibel. If the figure following the decimal point is between 0 and 4, the total is rounded down and if it is between 5 and 9, it is rounded up.

Justification: The subparagraphs of paragraph 3.1 were restructured and amended in order to make the text more comprehensive.

The existing paragraph 4, “Interpretation of results for vehicles in motion” was integrated into paragraph 3.1, because it deals exclusively with the results of 3.1. Rounding procedures were amended in order to align them with Regulation 41-04.

3.1.1. Positions for the test

3.1.1.1. The maximum weighted sound level (A), expressed in decibels (dB), shall be measured as the vehicle is driven between lines AA’ and BB’ (Figure 1). The measurement shall be invalid if an abnormal discrepancy between the peak value and the general sound level is recorded.

At least two measurements shall be made on each side of the vehicle.

Preliminary measurements may be made for adjustment purposes, but shall be disregarded.

3.1.1.2. The distance of the microphone positions from the line CC’, on the microphone line PP’, perpendicular to the reference line CC’ on the test track (Figure 1 of Appendix to this annex), shall be 7.5 ± 0.05 m.

The microphones shall be located 1.2 ± 0.02 m above the ground level. The reference direction for free-field conditions (see IEC 61672-1:2002) shall be horizontal and directed perpendicularly towards the path of the vehicle line CC’.

3.1.1.3. Two lines, AA’ and BB’, parallel to line PP’ and situated respectively 10 m forward and 10 m rearward of that line shall be marked out on the test runway. The vehicle shall approach line AA’ at a steady speed as specified below. The throttle shall then be fully opened as rapidly as practicable and held in the fully opened position until the rear of the vehicle crosses line BB’; the throttle shall then be closed again as rapidly as possible.

3.1.1.4. In the case of articulated vehicles consisting of two non-separable units regarded as a single vehicle, the semi-trailer shall be disregarded in determining when line BB’ is crossed.

3.1.1.5. The values, rounded off to the nearest whole decibel, shall be taken from the measuring apparatus. If the figure following the decimal point is between 0 and 4, the total is rounded down and if between 5 and 9, it is rounded up.

Only values which are obtained from two consecutive measurements on the same side of the vehicle, and do not differ by more than 2 dB(A), shall be accepted.

The result of the measurement shall be determined in accordance with paragraph 4. of this annex.

3.1.2. Determination of the steady speed

3.1.2.1. Vehicle with no gearbox

The vehicle shall approach line AA’ at a steady speed corresponding either, in terms of engine speed, (min⁻¹) to three-quarters of the rated engine speed, or to
three quarters of the maximum engine speed permitted by the governor, or to 50 km/h, whichever is the lowest.

3.1.2.2. Vehicle with a manually operated gearbox

If the vehicle is fitted with a two-speed, a three-speed or a four-speed gearbox, the second gear shall be used. If the vehicle has more than four speeds, the third gear shall be used. If, by following the above procedure, the engine speed developed exceeds its maximum permissible regime, the first higher gear which ensures that this regime is no longer exceeded up to the line BB' of the measurement area should be used instead of the second or third gear. Auxiliary step-up ratios ("overdrive") shall not be engaged. If the vehicle is fitted with a differential with two gear ratios, the ratio selected shall be that allowing the highest vehicle speed. The vehicle shall approach line AA' at a steady speed corresponding either, in terms of engine speed, to three quarters of the rated engine speed or to three quarters of the maximum engine speed permitted by the governor, or to 50 km/h, whichever is the lowest.

3.1.2.3. Vehicle with an automatic transmission

The vehicle shall approach the line AA' at a steady speed of 50 km/h or at three quarters of its maximum speed, whichever is the lower. Where several forward drive positions are available, that position shall be selected which results in the highest mean acceleration of the vehicle between lines AA' and BB'. The selector position which is used only for engine braking, parking or similar slow manoeuvres shall not be used.

3.2. Measurement of noise emitted by stationary vehicles (for testing of vehicles in service)

3.2.1. Acoustic sound pressure level close to the outlet(s) of the exhaust system of vehicles

Justification: More comprehensive text.

In addition, so as to facilitate the subsequent testing of vehicles in service, the acoustic sound pressure level shall be measured near the outlet of the exhaust system (silencing system), in conformity with the requirements set out below, and the result of the measurement shall be included in the test report prepared for the issuance of the document referred to in Annex 1 to this Regulation.

3.2.2. Measuring instruments

The measurements shall be made using a precision sound-level meter in accordance with paragraph 1. of this annex.

3.2.3. Conditions for measurements

3.2.3.1. Condition of the vehicle

Before the measurements are started, the vehicle engine shall be brought to its normal operating temperature. If the vehicle is equipped with automatic fans, no adjustment shall be made to them during the measurement of the acoustic sound level.

While measurements are being made, the gear lever shall be in neutral. If the transmission cannot be disconnected, the drive wheel of the vehicle should be allowed to run under no-load conditions by, for example, placing the vehicle on a support or on rollers.

3.2.3.2. Test site
Any area not subject to major acoustic perturbations may be used as a test site. Level areas covered with concrete, asphalt or some other hard material and are highly reflective are suitable; surfaces consisting of earth which has been tamped down shall not be used. The test site shall have at least the dimensions of a rectangle the sides of which shall be 3 m from the outline of the vehicle (excluding handlebars). No significant obstacle such as a person other than the observer and the driver shall be within this rectangle.

The vehicle shall be placed within the above-mentioned rectangle in such a way that the measuring microphone is at least one metre from any stone edging.

3.2.3.3. Miscellaneous

Instrument readings caused by ambient or wind noise shall be at least 10 dB(A) less than the noise level to be measured. The microphone may be fitted with a suitable wind-guard provided that its effect on microphone sensitivity is taken into account.

3.2.4. Method of measurement

3.2.4.1. Number of measurements

At least three measurements shall be made at each measurement point. The measurements shall be considered valid only if the difference between the results of three consecutive measurements is not more than 2 dB(A).

3.2.4.2. Positioning of the microphone (see Figure 2 of Appendix to this annex)

The microphone shall be located at a distance of 0.5 ± 0.01 m from the reference point of the exhaust pipe defined in Figure 4 of Appendix to this annex and at an angle of 45 ± 5° to the vertical plane containing the flow axis of the pipe termination. The microphone shall be at the height of the reference point, but not less than 0.2 m from the ground surface. The reference axis of the microphone shall lie in a plane parallel to the ground surface and shall be directed towards the reference point on the exhaust outlet.

Figure 2: Microphone positions for the measurement of sound of the stationary vehicle
The reference point (see figure 3) shall be the highest point satisfying the following conditions:

(a) The reference point shall be at the end of the exhaust pipe,
(b) The reference point shall be on the vertical plane containing the exhaust outlet centre and the flow axis of the exhaust pipe termination.

If two microphone positions are possible, the location farthest laterally from the vehicle longitudinal centreline shall be used.

If the flow axis of the exhaust outlet pipe is at 90° ± 5° to the vehicle longitudinal centreline, the microphone shall be located at the point that is the furthest from the engine.

If a vehicle has two or more exhaust outlets spaced less than 0.3 m apart and connected to a single silencer, only one measurement shall be made. The microphone shall be located relative to the outlet the farthest from the vehicle's longitudinal centreline, or, when such outlet does not exist, to the outlet that is highest above the ground.
For vehicles having an exhaust provided with outlets spaced more than 0.3 m apart, one measurement is made for each outlet as if it were the only one, and the highest sound pressure level shall be noted.

For the purpose of roadside checking, the reference point may be moved to the outer surface of the vehicle body.

For vehicles equipped with multiple exhaust outlets, the reported sound pressure level shall be for the outlet having the highest average sound pressure level.

### 3.2.4.3. Operating conditions

The engine speed shall be held steady at one of the following values:

- \( \frac{2}{5} \) 50 per cent of \( n_{\text{rated}} \) if \( n_{\text{rated}} \) exceeds 5,000 min\(^{-1} \)
- \( \frac{3}{4} \) 75 per cent of \( n_{\text{rated}} \) if \( n_{\text{rated}} \) does not exceed 5,000 min\(^{-1} \)

Where \( n_{\text{rated}} \) is the rated engine speed as defined in paragraph 2.2.3.2 of this regulation at which the engine produces its maximum power.

**Justification:** Makes the text more comprehensive.

For a vehicle which cannot reach, in a stationary test, the target engine speed defined above, 95 per cent of the maximum engine speed reachable in a stationary test shall be used instead as target engine speed.

The engine speed shall be gradually increased from idle to the target engine speed and held constant within a tolerance band of ±5 per cent. Then the throttle control shall be rapidly released and the engine speed shall be returned to idle. The sound pressure level shall be measured during a period consisting of constant engine speed of at least 1 s and throughout the entire deceleration period. The maximum sound level meter reading shall be taken as the test value.

A measurement shall be regarded as valid only if the test engine speed did not deviate from the target engine speed by more than the specified tolerance of ±5 per cent for at least 1 s.

### 3.2.4.4. Measurements

Measurements shall be made at the microphone location(s) prescribed above. The maximum A-weighted sound pressure level indicated during the test shall be noted, retaining one significant figure behind the decimal place (e.g. 92.45 shall be noted as to 92.5 while 92.44 shall be noted as to 92.4).

The test shall be repeated until three consecutive measurements that are within 2.0 dB(A) of each other are obtained at each outlet.

The test result for a given outlet is the arithmetic average of the three valid measurements, mathematically rounded to the nearest integer value (e.g. 92.5 shall be noted as to 93 while 92.4 shall be noted as to 92).

### 3.2.4.5. Multi-mode exhaust system

#### 3.2.4.5.1. Vehicles equipped with a multiple mode, manually adjustable exhaust system shall be tested in all modes.

#### 3.2.4.5.2. For vehicles equipped with a multi-mode exhaust system and a manual exhaust mode control the reported sound pressure level shall be for the mode having the highest average sound pressure level.

### 4. Interpretation of results for vehicles in motion
The values taken shall be rounded off to the nearest whole decibel. If the figure following the decimal point is between 0 and 4, the total is rounded down and if between 5 and 9, it is rounded up.

Only the values of readings obtained from two consecutive measurements made on the same side of the vehicle and not differing by more than 2 dB(A) shall be accepted.

To allow for lack of precision in the readings, the result of each measurement shall be taken as equal to the value obtained, minus 1 dB(A).

If the average of the four readings does not exceed the maximum permissible level for the category to which the tested vehicle belongs, the limit specified in paragraph 6.2.1.3 of this Regulation shall be deemed as being complied with. This average value shall constitute the test result.

Comment: The text of paragraph 4 was copied from ECE R 41 and was amended accordingly to Annex 3 of this Regulation.

4. Sound from the vehicle in motion (data reported to facilitate testing of the vehicle in use).

4.1. A test procedure for in-use compliance tests may be defined by a Contracting Party, taking due account of any differences from the test conditions used at type-approval.

4.2. In order to facilitate in-use compliance test of vehicles, the following information relating to the sound-pressure level measurements carried out in accordance with paragraph 1. of Annex 3 for the vehicle in motion is referred to as in-use compliance reference data:

(a) Gear (i) or, for vehicles tested with non-locked gear ratios, the position of the gear selector chosen for the test;

(b) The vehicle speed $v_{AA'}$ in km/h at the beginning of the full throttle acceleration test in gear (i); and

(c) The final test result in dB(A) as determined according to paragraph 3.1 of this annex.

4.3. The in-use compliance reference data shall be entered in the communication form conforming to Annex 1.

Justification: With regard to in service conformity tests it is well known from former research studies that stationary tests are not very effective, because there is not enough load on the engine and silencers can be constructed such as to comply with stationary tests but lead to excessive sound emissions for full load acceleration tests. It is therefore recommended to perform in service conformity tests according to annex 3, paragraph 3.1 as already implemented in Regulation 41-04.

5. Original exhaust (silencing) system

5.1. Requirements for silencers containing absorbent fibrous materials

5.1.1. Fibrous absorbent material shall be asbestos-free and may be used in the construction of silencers only if suitable devices ensure that the fibrous absorbent material is kept in place for the whole time that the silencer is being used and the exhaust or silencing system meets the requirements of any one of paragraphs 5.1.2., 5.1.3. or 5.1.4. below.
5.1.2. After removal of the fibrous material, the sound-level shall conform to the requirements of paragraph 6.2.1.3. of this Regulation.

5.1.3. The fibrous absorbent material may not be placed in those parts of the silencer through which the exhaust gases pass and shall conform to the following requirements:

5.1.3.1. The material shall be heated at a temperature of 650 ± 5 °C for four hours in a furnace without reduction in the average length, diameter or bulk density of the fibre;

5.1.3.2. After heating at 650 ± 5 °C for one hour in a furnace, at least 98 per cent of the material shall be retained in a sieve of nominal aperture size 250 μm conforming to ISO standard 3310-1:1999 when tested in accordance with ISO standard 2559:2000.

5.1.3.3. The loss in weight of the material shall not exceed 10.5 per cent after soaking for 24 h at 90 ± 5 °C in a synthetic condensate of the following composition:

- 1 N hydrobromic acid (HBr) 10 ml
- 1 N sulphuric acid (H₂SO₄) 10 ml
- Distilled water to make up to 1,000 ml

Note: The material must be washed in distilled water and dried for one hour at 105 °C before weighing.

5.1.4. Before the system is tested in accordance with paragraph 3. above, it shall be put into a normal state for road use by one of the following methods:

5.1.4.1. Conditioning by continuous road operation

5.1.4.1.1. Depending on the category of vehicle, the minimum distances to be completed during conditioning shall be:

<table>
<thead>
<tr>
<th>Vehicle class according to power to mass ratio index (PMR) - Category of vehicle according to cylinder capacity in cm³</th>
<th>Distance (km)</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 25 1 - ≤ 250 2</td>
<td>4 000</td>
</tr>
<tr>
<td>&gt; 25 and ≤ 50 2 - &gt; 250 2 - ≤ 500 2</td>
<td>6 000</td>
</tr>
<tr>
<td>&gt; 50 2 - &gt; 500 2</td>
<td>8 000</td>
</tr>
</tbody>
</table>

Justification: alignment with Regulation 41-04.

5.1.4.1.2. 50 per cent ± 10 per cent of this conditioning cycle shall consist of town driving and the remainder of long-distance runs at high vehicle speed; the continuous road cycle may be replaced by a corresponding test-track programme;

5.1.4.1.3. The two vehicle speed regimes shall be alternated at least six times;

5.1.4.1.4. The complete test programme shall include a minimum of 10 breaks of at least 3 h duration in order to reproduce the effects of cooling and condensation.

5.1.4.2. Conditioning by pulsation

5.1.4.2.1. The exhaust system or components thereof shall be fitted to the vehicle or to the engine.
In the former case, the vehicle shall be mounted on a roller dynamometer. In the second case, the engine shall be mounted on a test bench.

The test apparatus, a detailed diagram of which is shown in Figure 3–4 of Appendix to this annex, shall be fitted at the outlet of the exhaust system. Any other apparatus providing equivalent results shall be acceptable.

Figure 4 Test apparatus for conditioning by pulsation

1. Inlet flange or sleeve for connection to the rear of the test exhaust system
2. Hand-operated regulating valve.
3. Compensating reservoir with a maximum capacity of 40 l and a filling time of not less than one second.
4. Pressure switch with an operating range of 5 to 250 kPa.
5. Time delay switch.
6. Pulse counter.
7. Quick-acting valve, such as exhaust brake valve 60 mm in diameter, operated by a pneumatic cylinder with an output of 120 N at 400 kPa. The response time, both when opening and closing, shall not exceed 0.5 seconds.
8. Exhaust gas evacuation.

5.1.4.2.2. The test equipment shall be adjusted so that the flow of exhaust gases is alternately interrupted and restored 2,500 times by a rapid-action valve.

5.1.4.2.3. The valve shall open when the exhaust gas back-pressure, measured at least 100 mm downstream of the intake flange, reaches a value of between 35 and 40 kPa. Should such a figure be unattainable because of the engine characteristics, the valve shall open when the gas back-pressure reaches a level
equivalent to 90 per cent of the maximum that can be measured before the engine stops. It shall close when this pressure does not differ by more than 10 per cent from its stabilized value with the valve open.

5.1.4.2.4. The time-delay switch shall be set for the duration of exhaust gases calculated on the basis of the requirements of paragraph 5.1.4.2.3. above.

5.1.4.2.5. The engine speed shall be 75 per cent of the rated engine speed as defined in paragraph 2.2.3.2 of this regulation, at which the engine develops maximum power.

5.1.4.2.6. The power indicated by the dynamometer shall be 50 per cent of the full-throttle power measured at 75 per cent of the rated engine speed as defined in paragraph 2.2.3.2 of this regulation.

Justification: More comprehensive text.

5.1.4.2.7. Any drainage holes shall be closed off during the test.

5.1.4.2.8. The entire test shall be completed within 48 hours. If necessary, a cooling period shall be allowed after each hour.

5.1.4.3. Conditioning on a test bench

5.1.4.3.1. The exhaust system shall be fitted to an engine representative of the type fitted to the vehicle for which the system is designed, and mounted on a test bench.

5.1.4.3.2. Conditioning shall consist of the specified number of test-bench cycles for the category of vehicle for which the exhaust system was designed. The number of cycles for each vehicle category shall be:

<table>
<thead>
<tr>
<th>Category of vehicle according to cylinder capacity in cm³</th>
<th>Number of cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ≤ 250</td>
<td>6</td>
</tr>
<tr>
<td>2. &gt; 250 and ≤ 500</td>
<td>9</td>
</tr>
<tr>
<td>3. &gt; 500</td>
<td>12</td>
</tr>
</tbody>
</table>

Justification: alignment with Regulation 41-04.

5.1.4.3.3. Each test-bench cycle shall be followed by a break of at least six hours in order to reproduce the effects of cooling and condensation.

5.1.4.3.4. Each test-bench cycle shall consist of six phases. The engine conditions for, and the duration of, each phase shall be:

<table>
<thead>
<tr>
<th>Phase</th>
<th>Conditions</th>
<th>Duration of phase</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

**Justification:** Alignment with Regulation 41-04.

5.1.4.3.5. During this conditioning procedure, at the request of the manufacturer, the engine and the silencer may be cooled in order that the temperature recorded at a point not more than 100 mm from the exhaust gas outlet does not exceed that measured when the vehicle is running at 110 km/h or 75 per cent of the rated engine speed as defined in paragraph 2.2.1.2 of this regulation in top gear. The engine and/or vehicle speeds shall be determined within with a tolerance of ±3 per cent.

**Justification:** More comprehensive text.

5.2. **Diagram and markings**

5.2.1. The diagram and a dimensioned cross-section of the silencer shall be annexed to the document mentioned in Annex 1 to this Regulation.

5.2.2. All original silencers shall bear at least the following:

   (a) the ‘E’ mark followed by the reference to the country which granted the type-approval;

   (b) the vehicle manufacturer’s name or trademark; and

   (c) the make and identifying part number.

   This reference shall be legible, indelible and visible in the position at which it is to be fitted.

5.2.2. All original silencing systems shall be marked with an "E" followed by the identification number of the approving country. This reference shall be clearly legible and indelible and shall also be visible after mounting.

**Justification:** Paragraphs 5.2.2 was added in order to make tampering more difficult.

5.2.3. Any packaging of original replacements for exhaust or silencing systems shall be marked legibly with the words "original part" and the make and type reference integrated together with the "E" mark and also the reference of the country of origin.

5.3. **Intake silencers**

If the engine intake has to be fitted with an air filter and/or intake silencer in order to comply with the permissible sound level, the filter and/or silencer shall be regarded as part of the silencer and the requirements of paragraphs 5.4.1. and 5.2. above shall also be applicable to them.

Justification: The limit values were moved from paragraph 6 of this Regulation to the table in this annex for alignment with other regulations (e.g. R 63 and R 41-04).
Annex 5

Specifications for the test site¹

1. Introduction

This annex describes the specifications relating to the physical characteristics and the laying of the test track. These specifications based on a special standard² describe the required physical characteristics as well as the test methods for these characteristics.

2. Required characteristics of the surface

A surface is considered to conform to this standard provided that the texture and voids content or sound absorption coefficient have been measured and found to fulfill all the requirements of paragraphs 2.1 to 2.4 below and provided that the design requirements (paragraph 3.2 below) have been met.

2.1. Residual voids content

The residual voids content, \( V_C \), of the test track paving mixture shall not exceed 8 per cent. For the measurement procedure, see paragraph 4.1 below.

2.2. Sound absorption coefficient

If the surface fails to conform to the residual voids content requirement, the surface is acceptable only if its sound absorption coefficient, \( \alpha \leq 0.10 \). For the measurement procedure, see paragraph 4.2 below. The requirements of paragraphs 2.1 above and this paragraph are met also if only sound absorption has been measured and found to be \( \alpha \leq 0.10 \).

Note: The most relevant characteristic is the sound absorption, although the residual voids content is more familiar among road constructors. However, sound absorption needs to be measured only if the surface fails to comply with the voids requirement. This is because the latter is connected with relatively large uncertainties in terms of both measurements and relevance and some surfaces therefore may be rejected erroneously on the basis of the voids measurement only.

2.3. Texture depth

The texture depth (TD) measured according to the volumetric method (see paragraph 4.3 below) shall be:

\[ TD \geq 0.4 \text{ mm} \]

¹ The specifications for the test site reproduced in this annex are valid until the end of the period indicated in paragraph 11 of this Regulation.

² ISO 10844:1994
2.4. Homogeneity of the surface

Every practical effort shall be made to ensure that the surface is made to be as homogeneous as possible within the test area. This includes the texture and voids content, but it should also be observed that if the rolling process results in more effective rolling at some places than at others, the texture may be different and unevenness causing bumps may also occur.

2.5. Period of testing

In order to check whether the surface continues to conform to the texture and voids content or sound absorption requirements stipulated in this standard, periodic testing of the surface shall be done at the following intervals:

(a) For residual voids content or sound absorption:
   When the surface is new; if the surface meets the requirements when new, no further periodical testing is required.

(b) For texture depth (TD):
   When the surface is new; when the noise testing starts (Note: Not before four weeks after laying); then every 12 months.

3. Test surface design

3.1. Area

When designing the test track layout it is important to ensure that, as a minimum requirement, the area traversed by the vehicles running through the test strip is covered with the specified test material with suitable margins for safe and practical driving. This will require the width of the track to be at least 3 m and the length of the track to extend beyond lines AA and BB by at least 10 m at either end. Figure 1 shows a plan of a suitable test site and indicates the minimum area which shall be machine laid and machine compacted with the specified test surface material. According to Annex 3, paragraph 3.1.1.1., measurements have to be made on each side of the vehicle. This can be done either by measuring with two microphone locations (one on each side of the track) and driving in one direction, or measuring with a microphone only on one side of the track but driving the vehicle in two directions. If the latter method is used, then there are no surface requirements on that side of the track where there is no microphone.
### 3.2. Design and preparation of the surface

#### 3.2.1. Basic design requirements; the test surface shall meet four design requirements:

1. **It shall be a dense asphaltic concrete**;

2. **The maximum chipping size shall be 8 mm (tolerances allow from 6.3 to 10 mm)**;

3. **The thickness of the wearing course shall be \( \geq 30 \text{ mm} \)**;

4. **The binder shall be a straight penetration grade bitumen without modification**.

#### 3.2.2. Design guidelines

As a guide to the surface constructor, an aggregate grading curve which will give desired characteristics is shown in Figure 2. In addition, Table 1 gives some guidelines for obtaining the desired texture and durability. The grading curve fits the following formula:

\[
P (\% \text{ passing}) = 100 \cdot \left(\frac{d}{d_{\text{max}}}\right)^{1/2}
\]

where:

- \( d \) = square mesh sieve size, in mm
- \( d_{\text{max}} \) = 8 mm for the mean curve

---

**Figure 1**

Minimum requirement for test surface area. The shaded part is called "Test Area"
\[ d_{\text{max}} = 10 \text{ mm for the lower tolerance curve} \]
\[ d_{\text{max}} = 6.3 \text{ mm for the upper tolerance curve} \]
In addition to the above, the following recommendations are given:

(a) The sand fraction (0.063 mm < square mesh sieve size < 2 mm) shall include no more than 55 per cent natural sand and at least 45 per cent crushed sand;

(b) The base and sub-base shall ensure a good stability and evenness, according to best road construction practice;

(c) The chippings shall be crushed (100 per cent crushed faces) and of a material with a high resistance to crushing;

(d) The chippings used in the mix shall be washed;

(e) No extra chippings shall be added onto the surface;

(f) The binder hardness expressed as PEN value shall be 40-60, 60-80 or even 80-100 depending on the climatic conditions of the country. The rule is that as hard a binder as possible shall be used, provided this is consistent with common practice;

(g) The temperature of the mix before rolling shall be chosen so as to achieve by subsequent rolling the required voids content. In order to increase the probability of satisfying the specifications of paragraphs 2.1. to 2.4. above, the compactness shall be studied not only by an appropriate choice of mixing temperature, but also by an appropriate number of passing and by the choice of compacting vehicle.

4. **Test method**

4.1. **Measurement of the residual voids content**

For the purpose of this measurement, cores have to be taken from the track in at least four different positions which are equally distributed in the test area between lines AA and BB (see Figure 1). In order to avoid in homogeneity and unevenness in the wheel tracks, cores should not be taken in wheel tracks themselves, but close to them. Two cores (minimum) should be taken close to the wheel tracks and one core (minimum) should be taken approximately midway between the wheel tracks and each microphone location.

If there is a suspicion that the condition of homogeneity is not met (see paragraph 2.4. above), cores shall be taken from more locations within the test area. The residual voids content has to be determined for each core, then the average value from all cores shall be calculated and compared with the requirement of paragraph 2.1. above. In addition, no single core shall have a voids value which is higher than 10 per cent. The test surface constructor is reminded of the problem which may arise when the test area is heated by pipes or electrical wires and cores shall be taken from this area. Such installations shall be carefully planned with respect to future core drilling locations. It is recommended that a few locations of size approximately 200 x 300 mm should be left where there are no wires/pipes or where the latter are located deep enough in order not to be damaged by cores taken from the surface layer.

4.2. **Sound absorption coefficient**

The sound absorption coefficient (normal incidence) shall be measured by the impedance tube method using the procedure specified in ISO/DIS 10 534: "Acoustics - Determination of sound absorption coefficient and impedance by a tube method".

Regarding test specimens, the same requirements shall be followed as regarding the residual voids content (see paragraph 4.1 above).

The sound absorption shall be measured in the range between 400 Hz and 800 Hz and in the range between 800 Hz and 1,600 Hz (at least at the centre frequencies of third octave bands) and the maximum values shall be identified for both of these frequency ranges.
Then these values, for all test cores, shall be averaged to constitute the final result.

4.3. Volumetric macrotexture measurement

For the purpose of this standard, texture depth measurements shall be made on at least 10 positions evenly spaced along the wheel tracks of the test strip and the average value taken to compare with the specified minimum texture depth. For the description of the procedure see standard ISO 10844:1994.

5. Stability in time and maintenance

5.1. Age influence

In common with any other surfaces, it is expected that the tyre/road noise level measured on the test surface may increase slightly during the first 6-12 months after construction.

The surface will achieve its required characteristics not earlier than four weeks after construction.

The stability over time is determined mainly by the polishing and compaction by vehicles driving on the surface. It shall be periodically checked as stated in paragraph 2.5. above.

5.2. Maintenance of the surface

Loose debris or dust which could significantly reduce the effective texture depth shall be removed from the surface. In countries with winter climates, salt is sometimes used for de-icing. Salt may alter the surface temporarily or even permanently in such a way as to increase noise, and is therefore not recommended.

5.3. Repaving the test area

If it is necessary to repave the test track, it is usually unnecessary to repave more than the test strip (of 3 m width in Figure 1) where vehicles are driving, provided the test area outside the strip met the requirement of residual voids content or sound absorption when it was measured.

6. Documentation of the test surface and of tests performed on it

6.1. Documentation of the test surface

The following data shall be given in a document describing the test surface:

6.1.1. The location of the test track.

6.1.2. Type of binder, binder hardness, type of aggregate, maximum theoretical density of the concrete \(D_b\), thickness of the wearing course and grading curve determined from cores from the test track.

6.1.3. Method of compaction (e.g. type of roller, roller mass, number of passes).

6.1.4. Temperature of the mix, temperature of the ambient air and wind speed during laying of the surface.

6.1.5. Date when the surface was laid and name of the contractor.

6.1.6. All test results or at least the latest test result, including:

6.1.6.1. The residual voids content of each core;

6.1.6.2. The locations in the test area from where the cores for voids measurements have been taken;
6.1.6.3. The sound absorption coefficient of each core (if measured). Specify the results both for each core and each frequency range, as well as the overall average;

6.1.6.4. The locations in the test area from where the cores for absorption measurement have been taken;

6.1.6.5. Texture depth, including the number of tests and standard deviation;

6.1.6.6. The institution responsible for the tests according to paragraphs 6.1.6.1. and 6.1.6.2. above and the type of equipment used;

6.1.6.7. Date of the test(s) and date when the cores were taken from the test track.

6.2. Documentation of vehicle noise tests conducted on the surface

In the document describing the vehicle noise test(s) it should be stated whether all the requirements of this standard were fulfilled or not. Reference shall be given to a document according to paragraph 6.1. above describing the results which verify this.
Annex 6

Comment: This annex is copied from ECE R 41 (annex 7) and was completely amended and extended to vehicles with PMR $\leq 50$. It is necessary to perform validation tests in order to determine the margin $y$, which will be added to the limit values.

Justification: This annex is needed, if the ASEP requirements in paragraph 6 of this Regulation are accepted. For more detailed justification see paragraph 6.3 of this regulation.

Additional Sound Emission Provisions (ASEP)

1. Scope

1.1. This annex applies to vehicles of category L4 and L5.

1.2. Vehicles with variable gear ratios or automatic transmission with non-lockable gear ratios are exempted from the requirements of this annex, if the vehicle manufacturer provides technical documents to the type approval authority showing, that the vehicle’s engine speed at $BB'$ does neither exceed $n_{BB'} + 0.05 \times (n_{\text{rated}} - n_{\text{idle}})$ nor fall below $n_{BB'} - 0.05 \times (n_{\text{rated}} - n_{\text{idle}})$ for any test condition inside the ASEP control range defined in paragraph 2.5. below, where $n_{BB'}$ is the average engine speed at $BB'$ from the two valid acceleration tests according to paragraph 1. of Annex 3.

2. Additional sound emission requirements

2.1. Measuring instruments

The requirements for the measurement equipment are identical to those defined in paragraph 1. of Annex 3 for the tests of the vehicle in motion.

2.2. Acoustical environment, meteorological conditions and background noise

The requirements concerning the acoustical environment, the meteorological conditions and the background noise are identical to those defined in paragraph 1 of Annex 3 for the tests of the vehicle in motion.

2.3. Microphone positions and conditions of the vehicle

The requirements concerning the microphone positions and the conditions of the vehicle are identical to those defined in paragraphs 3 of Annex 3 for the tests of the vehicle in motion.

2.4. General operating conditions

The general operating conditions are identical to those defined in paragraph 1 of Annex 3 for the tests of the vehicle in motion.

2.5. ASEP control range

The requirements of this annex apply to any vehicle operation with the following restrictions:

(a) $v_{AA'}$ shall be at least 20 km/h

(b) $v_{BB'}$ shall not exceed 80 km/h

(c) $n_{AA'}$ shall be at least $0.1 \times (n_{\text{rated}} - n_{\text{idle}}) + n_{\text{idle}}$
2.6. ASEP limits

The maximum noise level recorded during the passage of the motorcycle through the test track shall not exceed the corresponding limit value according to annex 4 by more than \( y \) dB(A).

3. Testing compliance by measurements

3.1. General

The Type Approval Authority as well as the Technical Service may request tests to check the compliance of the motorcycle with the requirements of paragraph 2 above. To avoid undue work load testing is restricted to the reference points defined in paragraph 3.2. below and up to two additional operating conditions other than the reference points but inside the ASEP control range.

3.2. ASEP reference test conditions

3.2.1. Test procedure

When the front of the vehicle reaches AA', the throttle shall be fully engaged and held fully engaged until the rear of the vehicle reaches BB'. The throttle shall then be returned as quickly as possible to the idle position.

3.2.2. Test vehicle speed and gear selection

The vehicle shall be tested at the following operating condition:

\[
v_{BB'} \leq 80 \text{ km/h}
\]

\( n_{BB'} \) corresponding to

\[
0.85 \times (n_{\text{rated}} - n_{\text{idle}}) + n_{\text{idle}} \quad \text{for PMR} \leq 66 \text{ and}
\]

\[
3.4 \times \text{PMR}^{-0.33} \times (n_{\text{rated}} - n_{\text{idle}}) + n_{\text{idle}} \quad \text{for PMR} > 66
\]

\( n_{\text{rated}} \) is the rated engine speed as defined in paragraph 2.2.3.2 of this Regulation, \( n_{\text{idle}} \) is the idling engine speed as defined in paragraph 2.2.3.3 of this Regulation.

The corresponding \( v_{AA'} \) value needs to be determined by pretests.

The selected gear shall be 2\(^{nd}\). If the 3\(^{rd}\) gear satisfies requirements of \( n_{BB'} \) and \( v_{BB'} \), 3\(^{rd}\) shall be used. If the 4\(^{th}\) gear satisfies requirements of \( n_{BB'} \) and \( v_{BB'} \), 4\(^{th}\) shall be used.

3.2.3. Data processing and reporting

The requirements of paragraphs 3.1.3 and 3.1.4 of Annex 3 shall be applied.

4 ASEP limit

(d) \( n_{BB'} \) shall not exceed

\[
0.85 \times (n_{\text{rated}} - n_{\text{idle}}) + n_{\text{idle}} \quad \text{for PMR} \leq 66 \text{ and}
\]

\[
3.4 \times \text{PMR}^{-0.33} \times (n_{\text{rated}} - n_{\text{idle}}) + n_{\text{idle}} \quad \text{for PMR} > 66,
\]

\( n_{\text{rated}} \) is the rated engine speed as defined in paragraph 2.2.3.2 of this Regulation, \( n_{\text{idle}} \) is the idling engine speed as defined in paragraph 2.2.3.3 of this Regulation.
The final sound pressure levels for the full throttle acceleration shall not exceed the limits specified in annex 4 by more than [y] dB(A).
Statement of Compliance with the Additional Sound Emission Provisions

(Maximum format: A4 (210 x 297 mm))

........................ (Name of manufacturer) attests that vehicles of this type .......... (type with regard to its sound emission pursuant to Regulation No. 9) comply with the requirements of paragraph 6.3 of Regulation No. 9.

........................ (Name of manufacturer) makes this statement in good faith, after having performed an appropriate evaluation of the sound emission performance of the vehicles.

Date: ........................................................................................................

Name of authorized representative: ........................................................................

Signature of authorized representative: .................................................................

____________________"
