Economic Commission for Europe
Inland Transport Committee
World Forum for Harmonization of Vehicle Regulations
113th session
Geneva, 10-13 October 2017
Item 6(b) of the provisional agenda
Amendments to gas-fuelled vehicle regulations – Regulation No. 110 (CNG and LNG vehicles)

Proposal for amendments to Regulation No. 110 (CNG and LNG vehicles)

Submitted by the expert from the International Organization for Standardization *

The text reproduced below was prepared by the expert from the International Organization for Standardization (ISO) to harmonize the requirements on Compressed Natural Gas (CNG) and/or Liquefied Natural Gas (LNG) vehicles of UN Regulation No. 110 with those of the international standard ISO 11439:2013 (see report ECE/TRANS/WP.29/GRSG/91, para. 28). It is based on informal document GRSG-113-02 distributed during the 113th session of the Working Party on General Safety Provisions (GRSG). The modifications to the current text of UN Regulation No. 110 are marked in bold characters for new and strikethrough for deleted characters.

* In accordance with the programme of work of the Inland Transport Committee for 2016–2017 (ECE/TRANS/254, para. 159 and ECE/TRANS/2016/28/Add.1, cluster 3.1), the World Forum will develop, harmonize and update Regulations in order to enhance the performance of vehicles. The present document is submitted in conformity with that mandate.
I. Proposal

Paragraph 2. (References), amend to read:

"2. References

The following standards contain provisions that, through reference in this text, constitute provisions of this Regulation.

ASTM Standards*

ASTM B117-90  Test method of Salt Spray (Fog) Testing
ASTM B154-92  Mercurous Nitrate Test for Copper and Copper Alloys
ASTM D522-92  Mandrel Bend Test of attached Organic Coatings

Annex 3A

Paragraph 6.3.6., amend to read:

"6.3.6. Plastic liners

The tensile yield strength and ultimate elongation shall be determined in accordance with paragraph A.22. (Appendix A to this annex). Tests shall demonstrate the ductile properties of the plastic liner material at temperatures of -50 °C or lower by meeting the values specified by the manufacturer; the

** National Association of Corrosion Engineers.
†† United Nations Economic Commission for Europe; Regulations.
‡‡ United States of America Federal Regulations.
§§ Society of Automotive Engineers.
polymeric material shall be compatible with the service conditions specified in paragraph 4. of this annex. In accordance with the method described in paragraph A.23. (Appendix A to this annex), the softening temperature shall be at least 90 °C, and the melting temperature at least 100 °C."

Paragraph 6.12., amend to read:

"6.12. Exterior environmental protection

The exterior of cylinders shall meet the requirements of the environmental test conditions of paragraph A.14. (Appendix A to this annex). Exterior protection may be provided by using any of the following:

(a) A surface finish giving adequate protection (e.g. metal sprayed on aluminium, anodizing); or

(b) The use of a suitable fibre and matrix material (e.g. carbon fibre in resin); or

(c) A protective coating (e.g. organic coating, paint) that shall meet the requirements of paragraph A.9. (Appendix A to this annex).

Any coatings applied to cylinders shall be such that the application process does not adversely affect the mechanical properties of the cylinder. The coating shall be designed to facilitate subsequent in service inspection and the manufacturer shall provide guidance on coating treatment during such inspection to ensure the continued integrity of the cylinder.

Manufacturers are advised that an environmental performance test that evaluates the suitability of coating systems is provided in the informative Appendix H to this annex."

Annex 3A, Appendix A

"A.14. Acid Environmental test

On a finished cylinder the following test procedure should be applied:

(a) Exposing a 150 mm diameter area on the cylinder surface for 100 hours to a 30 per cent sulfuric acid solution (battery acid with a specific gravity of 1.219) while the cylinder is held at 26 MPa;

(b) The cylinder shall then be burst in accordance with the procedure defined in paragraph A.12. above and provide a burst pressure that exceeds 85 per cent of the minimum design burst pressure.

A.14.1. Scope

This test is applicable to type CNG-2, CNG-3 and CNG-4 designs only.

A.14.2. Cylinder set-up and preparation

The upper section of the cylinder will be divided into 5 distinct areas and marked for preconditioning and fluid exposure (see Figure A.1). The areas will be nominally 100 mm in diameter. The areas shall not overlap on the cylinder surface. While convenient for testing, the areas need not be oriented along a single line, but shall not overlap the immersed section of the cylinder.
Although preconditioning and fluid exposure is performed on the cylindrical section of the cylinder, all of the cylinder, including the domed sections, should be as resistant to the exposure environments as are the exposed areas.

**Figure A.1**
Cylinder orientation and layout of exposure areas

### A.14.3. Pendulum impact preconditioning

The impact body shall be of steel and have the shape of a pyramid with equilateral triangle faces and a square base, the summit and the edges being rounded to a radius of 3 mm. The centre of percussion of the pendulum shall coincide with the centre of gravity of the pyramid; its distance from the axis of rotation of the pendulum shall be 1 m. The total mass of the pendulum referred to its centre of percussion shall be 15 kg. The energy of the pendulum at the moment of impact shall be not less than 30 Nm and as close to that value as possible.

During pendulum impact, the cylinder shall be held in position by the end bosses or by the intended mounting brackets. The cylinder shall be un-pressurized during preconditioning.

### A.14.4. Environmental fluids for exposure

Each marked area is to be exposed to one of five solutions for 30 minutes. The same environment shall be used for each location throughout the test. The solutions are:

- **Sulphuric acid:** 19 per cent solution by volume in water;
- **Sodium hydroxide:** 25 per cent solution by weight in water;
- **5% Methanol/95% gasoline:** gasoline concentration of M5 fuel meeting the requirements of ASTM D4814;
- **Ammonium nitrate:** 28 per cent by weight in water;
- **Windshield washer fluid:** 50 per cent by volume solution of methyl alcohol and water.

When exposed, the test sample will be oriented with the exposure area uppermost. A pad of glass wool (approximately 0.5 mm thick and between 90 and 100 mm in diameter) shall be placed on the exposure area. Apply an amount of the test fluid to the glass wool sufficient to ensure that the pad is wetted evenly across its surface and through its thickness for the duration of the test, and that the concentration of the fluid is not changed significantly during the duration of the test.

### A.14.5. Pressure cycle and hold

The cylinder shall be hydraulically pressure cycled between not less than 2 MPa and not more than 26 MPa for a total of 3,000 cycles. The maximum pressurization rate shall be 2.75 MPa per second. After
pressure cycling, the cylinder shall be pressurized to 26 MPa and held at
that pressure a minimum of 24 hours and until the elapsed exposure time
(pressure cycling and pressure hold) to the environmental fluids equals
48 hours.

A.14.6. Acceptable results

The cylinder shall be hydraulically tested to destruction in accordance
with the procedure in paragraph A.12. The burst pressure of the
cylinder shall be not less than 80 per cent of the minimum design burst
pressure.”

*Paragraph A.16.*, amend to read:

"A.16. Penetration tests

A cylinder pressurised to 20 MPa ± 1 MPa with compressed gas shall be
penetrated by an armour piercing bullet with a diameter of 7.62 mm or
greater. The bullet shall completely penetrate at least one side wall of the
cylinder. **For type CNG-1 designs, the projectile shall impact the side
wall at 90°.** For type CNG-2, CNG-3 and CNG-4 designs, the projectile shall
impact the side wall at an approximate angle of 45°. The cylinder shall reveal
no evidence of fragmentation failure. Loss of small pieces of material, each
not weighing more than 45 grams, shall not constitute failure of the test. The
approximate size of entrance and exit openings and their locations shall be
recorded.”

*Paragraph A.22.*, amend to read:

"A.16. Tensile properties of plastics

The tensile yield strength and ultimate elongation of plastic liner material
shall be determined at -50 °C using ISO 527-2:1628, and meet the
requirements of paragraph 6.3.6. of Annex 3A.”

*Paragraph A.23.*, amend to read:

"A.23. **Melting Softening** temperature of plastics

Polymeric materials from finished liners shall be tested in accordance with
the method described in ISO 306, and meet the requirements of
paragraph 6.3.6. of Annex 3A. The softening temperature shall be at least
100°C.”

Annex 3A, Appendix H, shall be deleted.

II. **Justification**

A detailed justification on the modification proposed above can be found in GRSG-113-02,
