The era of autonomous vehicles

The presentation of the Deputy chief Management of scientific and technical research and information support of the Federal road Agency of the Ministry of transport of the Russian Federation
Kurguzov Vasilii
Objectives of intelligent transport systems for the future

Targets:
- control of individual vehicles on the basis of intelligent self-learning control systems
- increase the parameter tonne-km per day (from 450 to planned 1500 – 1900) for autonomous vehicles
- improving road safety (reducing road accidents depending on the share of unmanned vehicles in the stream)
- the prevention of terrorist threats
1. Without the development of intelligent transport systems for the movement of autonomous vehicles, it is impossible to realize the full potential of the use of autonomous vehicles, as well as to prevent the possible use of autonomous vehicles for terrorist purposes.

2. It is necessary to connect autonomous vehicles to the infrastructure, if the road is equipped with the systems car-infrastructure v2i.

3. It is necessary to give priority to the principles of managing autonomous vehicles and decision algorithms on the choice of this or that action by the car in the course of movement which can cause harm to property and first of all life and health of the person.
