PROPOSAL FOR DRAFT SUPPLEMENT 5 TO REGULATION No. 50

(Position, stop and direction indicator lamps for motorcycles)

Transmitted by the Working Party on Lighting and Light-Signalling (GRE)

Note: The text reproduced below was adopted by GRE at its forty-fourth, forty-fifth and forty-sixth sessions, and is transmitted for consideration to WP.29 and to AC.1. It is based on documents TRANS/WP.29/GRE/2000/4, not amended, TRANS/WP.29/GRE/2000/5, as amended, TRANS/WP.29/GRE/2000/13, not amended, and TRANS/WP.29/GRE/2001/19, as amended (TRANS/WP.29/GRE/44, paras. 19 and 21; TRANS/WP.29/GRE/45, paras. 31 and 34; TRANS/WP.29/GRE/46, para. 62). The presentation of the trichromatic coordinates was aligned with that used in Regulation No. 50.
Insert a new paragraph 3.1.4., to read:

"3.1.4. At the choice of the applicant, that the device may be installed on the vehicle with different inclinations of the reference axis in respect to the vehicle reference planes and to the ground or rotate around its reference axis or, in the case of a rear registration plate lamp, that the device may be fitted in more than one or a field of positions in relation to the space to be occupied by the registration plate; these different conditions of installation (or different positions) shall be indicated in the communication form."

Paragraph 3.2.1., amend to read:

"......... geometrical position(s) the device may be mounted on the vehicle; the axis of observation to be taken as the axis of reference in the tests ........ (horizontal angle $H = 0^\circ$, vertical angle $V = 0^\circ$) and the point to be taken as the centre of reference in the said tests; the drawings shall show the position intended for the approval mark and eventually the additional symbols in relation to the circle of the approval mark;"

Paragraph 7.8., amend to read:

"7.8. In general the intensities shall be measured with the light source(s) continuously alight.

In the case of lamps intended to work intermittently, precaution shall be taken to avoid overheating of the device. Depending on the construction of the device, for example, the use of light-emitting diodes (LED) or the need to take precautions to avoid overheating, it is allowed to measure the lamps in flashing mode.

This must be achieved by switching with a frequency of $f = 1.5 \pm 0.5$ Hz with the pulse width greater than 0.3 s, measured at 95 per cent peak light intensity.

In the case of replaceable filament lamps, the filament lamps shall be operated at reference luminous flux during on time. In all other cases the voltage as required in paragraph 8.1. shall be switched with a rise time and fall time shorter than 0.01 s; no overshoot is allowed.

In the case of measurements taken in flashing mode the reported luminous intensity shall be represented by the maximum intensity."

Annex 2, item 9., amend to read:

"9. Concise description: 3/

By category of lamp:

Colour of light emitted: red/selective yellow/white/amber 2/"
Number and category of filament lamp(s): 

Geometrical conditions of installation and relating variations, if any: 

Annex 4,

Add a new paragraph 1.3., to read:

"1.3. In the case where the device may be installed on the vehicle in more than one or in a field of different positions the photometric measurements shall be repeated for each position or for the extreme positions in the field of the reference axis specified by the manufacturer."

Paragraph 3.2., amend to read:

"3.2. For replaceable filament lamps: when equipped with filament lamps at 6.75 V, 13.5 V or 28.0 V the luminous intensity values produced shall be corrected. The correction factor is the ratio between the reference luminous flux and the mean value of the luminous flux found at the voltage applied (6.75 V, 13.5 V or 28.0 V). The actual luminous fluxes of each filament lamp used shall not deviate more than ± 5 per cent from the mean value. Alternatively a standard filament lamp may be used in turn, in each of the individual positions, operated at its reference flux, the individual measurements in each position being added together."

Annex 5, amend to read:

".........
Amber:  limit towards green : y # x - 0.120
        limit towards red   : y $ 0.390
        limit towards white : y # 0.790 - 0.670 x

Selective-yellow */: .........
..........

Annex 6, paragraph 3., amend to read:

"3. Angle of incidence

The manufacturer of the illuminating device shall specify one or more or a field of positions in which the device is to be fitted in relation to the space for the registration plate; when the lamp is placed in the position(s) specified by the manufacturer the angle of incidence of the light on the surface of the plate does not exceed 82° at any point of the surface to be illuminated, this angle being measured from the extremity of the illuminating area of the device which is furthest from the surface of the plate. If
there is more than one illuminating device, the foregoing
requirement shall apply only to the part of the plate intended to
be illuminated by the device concerned.

The device shall be so designed that no light is emitted directly
towards the rear, with the exception of red light if the device is
combined or grouped with a rear lamp.”
